

## **FNIHB-OR Nursing Policy and Procedure**

Section: **Professional Nursing Practice** Policy Number: **II - 08**  
Subject: **Documentation Standards** Issued: **March 31, 2015**  
Distribution: **All Nursing Facilities** Revised:

---

### **1. POLICY:**

- 1.1 Each nurse shall be responsible for clear, accurate, comprehensive and timely health records which are in accordance with relevant FNIHB-OR policies and the College of Nurses of Ontario's (CNO) documentation standards. All entries shall be:
- a. Dated (day/month/year and time)
  - b. Recorded in blue or black ink
  - c. Legible
  - d. Recorded in chronological order;
  - e. Written in SOAPIE format (Subjective, Objective, Assessment, Plan, Implementation, Evaluation); and
  - f. Signed by the nurse providing care/assessment/treatment (first initial, full surname, professional designation)
- 1.2 Nurses work in a variety of clinical settings and within varying scopes of practice. The detail required of nursing documentation in each setting is dictated by the duties and requirements of that practice setting.  
At minimum, the following information shall be included in the client's health record:
- a. A client assessment;
  - b. A written plan of care with evidence of involving the individual / family in the planning of care where appropriate;
  - c. Evidence of teaching to the individual / family; and
  - d. Evidence of an evaluation of the planned care (i.e. problem resolution, reason for discontinuing or continuing care).
- 1.3 Each nurse shall safeguard client health information.

### **2. PRINCIPLES:**

- 2.1 Health professionals are accountable for meeting professional documentation standards. Accurate and detailed documentation is a nurse's best defense in a legal proceeding (Canadian Nurses Protective Society [CNPS], 2007; CNO, 2008; CRNNS, 2005).
- 2.2 Documentation is necessary for:
- a. Communication between health care providers
  - b. Legal proof or evidence of the actual health care provided or not provided
  - c. Meeting legislative requirements
  - d. Quality improvement
  - e. Research (CNPS, 2007).

2.3 The client's health record must be concise, comprehensive and objective. Characteristics of quality documentation include:

- a. Factual
- b. Accurate
- c. Complete
- d. Current
- e. Organized

2.4 Failing to keep records as required, falsifying a record, signing or issuing a document that the nurse knows contains false statements, and/ or disclosing information about a client without consent all constitute professional misconduct.

### 3. DEFINITIONS:

3.1 **Nurse:** For the purpose of this policy, Nurse refers to Registered Nurses, Nurse Practitioners and Registered Practical Nurses.

3.2 **Personal Health Information:** Refers to any identifying information about clients that is in verbal, written or electronic form. Such information relates to the following:

- a. Physical or mental health (including family health history)
- b. Care previously provided
- c. A plan of service;
- d. Payments or eligibility for health care;
- e. Donation of body parts or substances, or information gained from testing these body parts or substances;
- f. A person's health number; or
- g. The name of a client's substitute decision-maker. (PHIPA, 2004)

3.3 **Documentation** - refers to charts, charting, recording, nurses' notes, and progress notes. Documentation (paper, electronic, audio or visual) is used to monitor a client's progress, communicate with the health care team, and reflect the nursing care provided to a client (CNO, 2008).

### 4. PROCEDURE:

4.1 Each nurse shall document all client interactions in accordance with the CNO's *Practice Standard – Documentation*.

4.2 The following charting guidelines have been adopted from a variety of sources, including the CNO's practice standard document, and are considered to be the standards for nurses working in the FNIHB-OR.

### **4.3 Detail and Frequency of Recording**

- 4.3.1 The amount of detail to be documented and the frequency of making those entries are determined by the complexity and acuity of the client's health problem; the degree of risk presented by the client and/or his condition; and by the medical/nursing interventions administered.
- 4.3.2 Nurses must use their best judgment when deciding the amount of detail and the frequency of his/her chart entries; however, the general rule is - the more acutely ill the client, the greater the detail and frequency required.

### **4.4 Record Chronologically**

- 4.4.1 Failure to record entries chronologically may result in miscommunication or misinterpretation of significant client data and potentially result in injury to the client. Failure to record events in chronological order may also cast suspicion on the accuracy of the record during legal proceedings and thus question the credibility of the health professional and the health record.
- 4.4.2 Entries are made on every line of the record. If any line or portion of a line is not used for that entry, a single line shall be drawn through each gap to eliminate the possibility of an entry being made out of chronological order.
- 4.4.3 If a "late entry" is made out of chronological order, it should be clearly marked as such. The nurse shall write "late entry" with the actual date and time the note is written. The nurse shall also write in parenthesis (the date and time that the actual event occurred).

### **4.5 Record Contemporaneously**

- 4.5.1 Events should be recorded as soon as reasonably possible after it occurs, particularly when the client's condition is more acute, emergent and/or complex.
- 4.5.2 Documenting the event as soon as possible improves the quality and accuracy of the record and thus admissibility of the health record during court proceedings. Entries must be made within 24 hours of the event occurring. In the event that a documentation error is made or an error of omission occurs, the nurse shall make the correction as soon as he/she becomes aware of the error and in accordance with 4.14 of this policy.

### **4.6 Record Accurately**

- 4.6.1 An accurate entry not only refers to the absence of errors, but also refers to entries which are clearly stated and without ambiguity. Inaccurate records may result in miscommunication or misinterpretation and thus potentially result in injury to the client.

#### **4.7 Record Concisely**

- 4.7.1 Only essential information should be recorded to enable information to be retrieved quickly from the record when needed and avoid sifting through extraneous, irrelevant material.
- 4.7.2 “Negative” or “absent findings” are not necessarily irrelevant or extraneous. Including these types of findings in the documentation should be considered relevant when they assist with the process of confirming or refuting the differential diagnoses. In some instances, the courts have determined that the failure to record that a task was performed despite a negative finding, inferred that it was not performed.

#### **4.8 Record Factually**

- 4.8.1 Recording is based on accurately perceived data obtained from a variety of sources, such as observation, inspection, palpation, auscultation. Verbal cues or statements made by a client may also be recorded into the entry; however, avoid assumptions or inferences about client statements.
- 4.8.2 The data should be described in quantitative terms wherever possible to reduce bias.

#### **4.9 Entries to be Made by the Individual Having Personal Knowledge of the Event(s)**

- 4.9.1 All entries should be made by the health professional who performed the action or observed the event (except when there is a designated recorder) to reduce the risk of errors and to maintain the credibility of the health record in the case of legal proceedings.

#### **4.10 Sign All Entries**

- 4.10.1 Signatures and initials should be easily identifiable. Whenever initials are used, the corresponding full signature must also be indicated on the record, to assist in identifying the person making the entry. All signatures are to include the nurse’s professional designation.

#### **4.11 Terminology and Abbreviations Should Be Uniform**

- 4.11.1 Uniform terminology and abbreviations should be used by all health care professionals working in FNIHB-OR. This consistency helps to eliminate misinterpretation of recorded data and potential risks of injury to the client.
- 4.11.2 A list of approved abbreviations is included in Appendix A.

#### **4.12 Note Any Consultations**

- 4.12.1 All nurse-initiated consultations with other health care team members should be noted in the client’s health record, showing timely reporting of any abnormal findings, medical direction given, and action taken. These entries must include the actual date and time of the consultation and any verbal physician orders must be clearly recorded.

#### 4.13 Refusal of Treatment / Against Medical Advice

- 4.13.1 The Nurse must request that the client or client's family sign the *Refusal of Treatment / Against Medical Advice* form.
- 4.13.2 The nurse must document the circumstances of the refusal; the information provided to the client/family about the potential consequences of refusing treatment; any additional client teaching, treatment or medication provided; and the reasons to seek medical attention in the future.

#### 4.14 Correcting Errors

- 4.14.1 If an error is made in the entry, do not attempt to erase, remove, or obliterate the erroneous entry.
- 4.14.2 A single line must be drawn through the incorrect word(s) and the nurse shall date and initial the correction. A nurse is **never to delete, alter or modify someone else's documentation.**

#### 4.15 Document in Ink

- 4.15.1 All entries are to be made in blue or black ink only. Pencils should not be used for documentation in the client health record or on the immunization records.
