| <b>Susceptibility and Resistance</b> | <p>Susceptibility is assumed to be universal and decreases with age. Children who acquire an invasive Hi infection prior to two years of age may not develop immunity.</p> <p>Risk factors for disease include host factors (chronic diseases) and exposure factors (household crowding, large household size, child care or nursery school attendance, low socioeconomic status, and school-aged siblings).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Case</b>                          | <p>Followup is required for all reports of Invasive <i>Haemophilus influenza</i>.</p> <p>Work with the case or proxy to identify and follow all contacts for type a or type b invasive disease and for cases where the type is not yet known. (refer to Contacts section). All other Hi infections e.g. type c to f, do not require contact management.</p> <p>Contact and interview the case. In situations where the case is too young or too ill to be interviewed, information should be obtained from family, health care providers, etc. Complete the <a href="#">Bacterial Disease Surveillance Form – <i>Haemophilus influenzae</i></a> dated March 2014 or later (section 7.3.2).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Contacts</b>                      | <p>When Hi type a or b or type pending is reported contact your Regional Communicable Disease Coordinator (RCDC) during regular business hours, or the Medical Officer of Health (MOH) on-call if it is outside regular business hours, to determine if chemoprophylaxis for contacts is necessary.</p> <p><b>Important Notes:</b></p> <ol style="list-style-type: none"> <li>1. A contact is defined as anyone living with or has spent 4 or more hours per day with the case, for at least 5 of the 7 days preceding the day of hospital admission of the case.</li> <li>2. All contacts of Hi type a, b or type pending should be identified and educated about the disease and when to seek medical attention.</li> <li>3. See below for which contacts should receive chemoprophylaxis.</li> <li>4. The aim of chemoprophylaxis is to eliminate nasopharyngeal carriage of bacteria and prevent transmission. To effectively prevent secondary spread, prophylaxis should be given concurrently to all contacts and be initiated as soon as possible. If more than 14 days have passed since the last contact with the case, the benefit of prophylaxis is likely to be decreased.</li> <li>5. Rifampin is the drug of choice for prophylaxis. Refer to Table 1 for dosage guidelines.</li> </ol> <p><u>For contacts of <b><i>Haemophilus influenza type b</i></b>:</u></p> <p><u>Chemoprophylaxis is recommended as follows:</u></p> <ul style="list-style-type: none"> <li>• For all household contacts (as defined above) living in: <ul style="list-style-type: none"> <li>o Household with at least 1 contact younger than 4 years of age who is unimmunized or incompletely immunized</li> <li>o Household with a child younger than 12 months of age who has not completed the primary Hib series</li> <li>o Household with a contact who is an immunocompromised child, regardless of that child's Hib vaccination status</li> </ul> </li> </ul> |

## Approval

Approved by Dr. Kim Barker, Chief Medical Officer of Health on April 27, 2016.

## 7.4.1 Measles (Rubeola)

### Special Precautions/Considerations

**Precautions:** Airborne

**Reporting**

**Notifiable:** Yes

**Reporting:** Immediate (as soon as suspected)

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Clinical Presentation</b> | <p>Prodromal fever, conjunctivitis, coryza, cough, Koplik spots (small spots with white or bluish-white centres on an erythematous base on the buccal mucosa). A characteristic red blotchy rash appears on the third to seventh day; the rash begins on the face and then becomes generalized and lasts 4-7 days.</p> <p>The disease is more severe in infants and in adults than in children.</p> <p>Complications may include otitis media, pneumonia, croup, diarrhea and encephalitis.</p> <p>Note that measles vaccine can produce a mild, non-transmissible and usually subclinical infection. The most frequent reaction (approximately 5% of immunized children) is malaise and fever with or without rash lasting up to 3 days and occurring 7-12 days after vaccination with measles-containing vaccine. It is important to differentiate this vaccine reaction from the clinical presentation of Measles disease.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Diagnostics</b>           | <p>Diagnosis of Measles is done by serologic testing and/or culture.</p> <ul style="list-style-type: none"> <li>• Measles specific IgM serology is the standard test of choice for routine diagnosis and is the first priority in the confirmation of Measles disease.</li> <li>• Demonstration of a significant increase (usually 4-fold rise) in measles specific IgG titre is a reliable alternative serologic method for diagnosis. <ul style="list-style-type: none"> <li>○ For IgG serology, <b>the first (acute) sample</b> should be obtained as soon as possible after the onset of the rash, and no later than 7 days after. <b>The second (convalescent) sample</b> should be collected 10-20 days after the first sample.</li> </ul> </li> <li>• All IgM positive sporadic cases with no epidemiological link to a laboratory-confirmed case or recent travel to an endemic area must be confirmed with additional testing such as virus isolation from urine and nasopharyngeal specimens or rise in IgG antibody between acute and convalescent sera.</li> <li>• Nasopharyngeal and urine samples are also used in the diagnosis of Measles. Isolation of measles virus from urine or nasopharyngeal swab is successful in 50-75% of samples submitted provided proper specimen collection, rapid transportation, and processing occur. These specimens should be submitted in addition to blood specimens to confirm Measles.</li> </ul> <p>Follow your regional laboratory procedures for serologic and other specimen testing.</p> |
| <b>Treatment</b>             | Supportive treatment as indicated. No specific treatment is available for Measles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                                      | <p>were infected by the age of 20. With the introduction of childhood immunization programs in many countries the number of reported Measles cases dropped. Despite the existence of a safe, effective and inexpensive measles vaccine for 40 years, Measles continues to occur throughout the world and remains the leading vaccine-preventable cause of death in children worldwide.</p> <p><b>Canada:</b> Sustained transmission has been eliminated by the current vaccine schedule and high vaccine coverage. However, imported cases continue to occur. Secondary spread from these imported cases is self-limited and often involves unimmunized individuals. Secondary spread to the general population is usually limited.</p> <p><b>Nunavut:</b> Since 2000 there has been one reported case of Measles.</p> |
| <b>Reservoir</b>                     | Humans                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Transmission</b>                  | Airborne by droplet spread, direct contact with nasal or throat secretions of infected persons; less commonly by articles freshly soiled with nose or throat secretions. Measles is one of the most highly communicable infectious diseases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Incubation Period</b>             | <p>About 10 days, but may be 7-18 days from exposure to onset of fever (rarely as long as 19-21 days). Average time from exposure to onset of rash is 14 days.</p> <p>Immune globulin (Ig) given for passive protection later than the third day of the incubation period may extend the incubation period.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Communicability</b>               | <p>From one day before the beginning of the prodromal period (usually about 4 days before rash onset) to 4 days after the appearance of the rash; minimal after the second day of rash. For those who are immunocompromised, the communicability lasts for the duration of the measles illness.</p> <p>The vaccine virus has not been shown to be communicable.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Susceptibility and Resistance</b> | <p>All persons who have not had the disease or been successfully immunized are susceptible.</p> <p>Acquired immunity after illness is permanent.</p> <p>Infants born to mothers who have had Measles are protected against the disease for the first 6-9 months or more. Maternal antibody interferes with response to vaccine. Immunization at 12-15 months of age induces immunity in 94% to 98% of recipients; re-immunization increases immunity levels to about 99%. Children born to mothers with vaccine-induced immunity receive less passive antibody; they may become susceptible to Measles at an earlier age.</p>                                                                                                                                                                                          |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Case</b>                          | <p>Confirm the diagnosis – ensure that all suspect cases receive prompt investigative procedures to confirm the case. Contact and interview the case or guardian. Complete the <a href="#">Vaccine Preventable Disease Report Form</a> dated March 2014 or later (section 10.4.2).</p> <p>Work with the case/guardian to compile a list of all susceptible contacts (see Contacts section).</p> <p>All persons (including healthcare workers) with Measles should be excluded from childcare, school, university or work until 4 days after the appearance of the rash. They should strive to remain isolated from susceptible individuals</p>                                                                                                                                                                         |

| <b>Clinical Presentation</b> | <p>Symptoms include fever, swelling and tenderness of one or more salivary glands, usually the parotid and sometimes the sublingual or submaxillary glands. Approximately one-third of infections do not cause clinically apparent salivary gland swelling and may manifest primarily as respiratory tract infection.</p> <p>Orchitis is a common complication after puberty but sterility rarely occurs; other rare complications include arthritis, thyroiditis, mastitis, glomerulonephritis and myocarditis.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Diagnostics</b>           | <p>Diagnosis of mumps is done by serologic testing (mumps IgM and IgG) and/or culture.</p> <p>IgM antibodies are usually present at the onset of illness (when glands are swollen) and reach a maximum level one week later. They may be present for several weeks or months following the illness, and decline with time (usually four to eight weeks). Recent vaccination with mumps vaccine or Measles, Mumps, Rubella (MMR) can elicit a mumps IgM antibody response.</p> <p>IgG antibodies are also detectable at the onset of illness reaching a peak in convalescence, then slowly declining over many years or decades.</p> <p>Recent data shows that mumps IgM antibody can be negative or indeterminate or the IgM response delayed in symptomatic individuals previously vaccinated with one or two doses of mumps-containing vaccine at the appropriate intervals.</p> <p>Mumps may also be confirmed by isolation of the virus in cell culture inoculated with throat washings (nasopharyngeal swab), saliva, urine or CSF, or by the detection of viral RNA by PCR in these samples.</p> <p>During an epidemic, the clinical diagnosis of Mumps is straightforward, however when cases are sporadic the clinical diagnosis is less reliable.</p> <p>Follow your regional laboratory procedures for serologic testing.</p> |
| <b>Treatment</b>             | Supportive treatment as indicated. No specific treatment is available for Mumps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Occurrence</b>            | <p><b>Worldwide:</b> Mumps is endemic throughout the world especially in heavily populated areas. The disease may also occur in epidemics where many unimmunized persons are crowded together. Mumps may occur at any age, however, the majority of reported cases are in children 5-10 years of age.</p> <p><b>Canada:</b> The number of reported cases has decreased by more than 99% since the licensure of Mumps vaccine in 1969. Approximately 500 cases of Mumps are reported annually in Canada. Outbreaks of Mumps have occurred in Nova Scotia, New Brunswick, PEI, Newfoundland, Quebec, Ontario,</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Transmission</b>                  | Person-to-person through direct contact with respiratory droplets from the mouth or nose of an infected person. The mumps virus can also survive on surfaces (fomites); contact with these surfaces followed by contact with the nose or mouth can also result in infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Incubation Period</b>             | Average length is 16-18 days, however can range from 14-25 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Communicability</b>               | From 6-7 days before the onset of symptoms and for as long as 9 days after illness onset. Maximum infectiousness occurs between 2 days before and 4 days after onset of illness.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Susceptibility and Resistance</b> | <p>Universal susceptibility. Disease (with or without symptoms) confers permanent immunity. Most individuals born in Canada before 1970 are believed to have likely been infected and can be considered immune. Immunization with mumps-containing vaccine provides approximately 80% protection against Mumps disease.</p> <p>Mumps infection in adulthood generally produces more severe disease. Disease is uncommon in children less than one year of age.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                              | Stage 2: Paroxysmal                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Paroxysms of numerous, rapid coughs due to difficulty expelling thick mucous from the tracheobronchial tree; each series has many coughs without intervening inhalation and can be followed by characteristic high-pitched inspiratory “whoop”. Paroxysms frequently end with expulsion of clear, tenacious mucous, often followed by vomiting and exhaustion or periods of apnea.<br><br>Paroxysmal attacks: <ul style="list-style-type: none"><li>• Occur frequently at night, with an average of 15 attacks per 24 hours.</li><li>• Increase in frequency during the first 1-2 weeks, remain at the same frequency for 2-3 weeks and then gradually decrease.</li></ul> | Usually 1-6 weeks; may persist up to 10 weeks |
|                              | Stage 3: Convalescent                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Gradual recovery with possible setbacks; cough becomes less paroxysmal and disappears.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Usually 7-10 days (range 4-21 days)           |
|                              | In infants less than 6 months of age, partially vaccinated children, adolescents and adults, classical symptoms may not be present.                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                               |
| <b>Diagnostics</b>           | B. pertussis nasopharyngeal (NP) specimens can be tested by PCR to detect pathogen. Follow your regional lab procedures. Use the specimen collection kit that is specific for pertussis.<br><br>Swab early in the course of illness. Do not collect a pertussis swab on patients if it is > 4 weeks after onset of illness. Do not collect a swab on treated patients if they have been on treatment for more than 1 week<br><br>Do not collect an NP swab in the same room where pertussis-containing vaccine is being given as it may render a false positive result. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                               |
| <b>Treatment</b>             | Antibiotics should be administered as soon as possible after the onset of illness.<br><br>Treatment eradicates B. pertussis from the nasopharynx but has no effect on                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                               |

the clinical symptoms or course of pertussis, unless given in the early (incubation period, catarrhal or early paroxysmal) stages of infection. There is no limit to the start date for treatment of confirmed cases of pertussis. Recommended medications for treatment and prophylaxis are outlined in the table that follows. Any of the following can be used for the treatment of pertussis.

| Antibiotic                                        | Dosage                                                                                                                                                                                                       | Comments                          |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------|
| Azithromycin                                      | <u>Children:</u><br>10 mg/kg PO daily for 1 day (max of 500mg); THEN 5 mg/kg PO daily for 4 days to a maximum of 250mg/day.<br><u>Adults:</u><br>500 mg po daily for 1 day; THEN 250 mg PO daily for 4 days. |                                   |
| Clarithromycin                                    | <u>Children:</u><br>15 mg/kg/day divided into 2 doses PO for 7 days to a maximum of 1000 mg/day.<br><u>Adults:</u><br>1000 mg XL PO once daily x 7 days.                                                     | Not recommended in pregnancy.     |
| Trimethoprim-sulfamethoxazole (Bactrim or Septra) | <u>Children:</u><br>8 mg/kg/day divided into 2 doses TMP PO for 10 days.<br><u>Adults:</u><br>Bactrim DS PO bid for 10 days.                                                                                 | Not for use in < 2 months of age. |

Note that the dosage regimen is the same for prophylaxis as for treatment. Guidance regarding who may require prophylaxis is included in the Contact section below.

## Pathogen

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Occurrence</b>   | <p><b>Worldwide:</b> Pertussis is considered endemic and common to children, with an incidence in children under 15 less than 1 per 100,000. Despite vaccination programs, globally there were still an estimated 48.5 million cases and an estimated 295,000 deaths (predominantly in Africa).</p> <p><b>Canada:</b> With the introduction of whole-cell pertussis vaccine in 1943, there has been a significant decline in disease incidence from an average of 165 cases per 100,000 person-years prior to 1935 to 4 per 100,000 person-years from 2007-2011. Pertussis is a cyclical disease and peaks at 2-5 year intervals, thus outbreaks continue to occur. From January to mid-August 2012, Canada experienced a 3.6 fold increase in reported cases.</p> <p><b>Nunavut:</b> From 2001-2015 there were between 0 to 6 cases per year, with the exception of one recorded outbreak in 2009 totalling 25 cases. Cases were generally reported in those less than 1 year old.</p> |
| <b>Reservoir</b>    | Humans. Adults and adolescents are considered to play a major role in the transmission of infection to infants and children.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Transmission</b> | <p>Direct contact with discharges from the respiratory mucous membranes of infected persons by the airborne route, probably via large droplets.</p> <p>In vaccinated populations, bacteria are frequently brought home by an older sibling or a parent.</p> <p>Indirect spread through the air or contaminated objects occurs rarely if at all.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Incubation Period</b>             | Average 9-10 days (range 6-20 days).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Communicability</b>               | <p>Pertussis is highly communicable, with a secondary attack rate of 80-90% among susceptible household contacts. It is most communicable in the early catarrhal stage and the beginning of the paroxysmal stage (i.e. the first 2 weeks of infection). Communicability then decreases and becomes negligible about 3 weeks after the onset of typical paroxysms in untreated individuals.</p> <p>Individuals treated with appropriate antibiotics can be considered non-infectious after 5 days of compliant treatment.</p> <p>Individuals may continue to have persisting cough after they are no longer infectious.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Susceptibility and Resistance</b> | <p>Susceptibility of non-immunized individuals is universal; partially immunized individuals are also susceptible. Previously immunized adolescents and adults are also susceptible due to waning immunity; these individuals are often a source of infection for partially or non-immunized young children.</p> <p>The incidence of pertussis in Canada is highest in infants and children, and decreases in those older than 14 years.</p> <p>Recent evidence suggests that immunity from B. pertussis infection may not be permanent, therefore people who have had pertussis should still receive all pertussis-containing doses according to the Nunavut Immunization schedule.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Case</b>                          | <p>Determine if the patient meets the case definition for pertussis. See case definitions under the Surveillance section.</p> <p>Complete the <a href="#">Vaccine Preventable Disease Report Form</a> dated May 2016 or later (section 12.0). During outbreak situations, enhanced case investigation forms may be used.</p> <p>Confirmed and probable cases of pertussis should be started on treatment as soon as possible. There is no limit to the start date for treatment of symptomatic, untreated cases of pertussis who are PCR positive. Treatment is under the direction of the attending health care provider.</p> <p>Advise cases to avoid contact with young children, infants and women in their third trimester of pregnancy (especially those who have not been immunized), until the completion of 5 days of appropriate antibiotic therapy or 21 days post cough onset.</p> <p>Exclusion is not a proven effective strategy in pertussis control. However, at the discretion of the Chief Medical Officer of Health (CMOH)/Deputy CMOH it can be recommended that cases be excluded from work, school, etc. if there are vulnerable* people present as follows:</p> <ul style="list-style-type: none"> <li>• Until 5 days after the start of antibiotic therapy, OR</li> <li>• If there is no treatment or treatment is incomplete, until 3 weeks (21 days) from onset of paroxysmal cough or until cough resolution (whichever comes first).</li> </ul> <p>* vulnerable individuals are defined as:</p> <ul style="list-style-type: none"> <li>• Infants less than 1 year of age, regardless of their immunization status.</li> <li>• Pregnant women in their third trimester.</li> <li>• Immuno-compromised individuals.</li> </ul> |

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Contacts</b> | <p>Collect information on potential contacts using the <a href="#">Vaccine Preventable Disease (VPD) Contact Investigation Form</a> (May 2016). Include additional pages for contact information as necessary.</p> <p><b>A. Contact identification</b></p> <p>Identify contacts who had the following types of <b>exposure</b> to a confirmed or probable case of pertussis during the period of communicability (i.e from start of catarrhal stage):</p> <ul style="list-style-type: none"> <li>• Shared respiratory secretions</li> <li>• Face-to-face exposure for greater than 5 minutes</li> <li>• Shared confined air (within 1 meter) for greater than one hour</li> </ul> <p><b>Household contacts</b></p> <ul style="list-style-type: none"> <li>• All individuals who live in the home including attendees at family daycare centres</li> <li>• Individuals who visit the household daily.</li> </ul> <p><b>Close non-household contacts</b></p> <ul style="list-style-type: none"> <li>• Will be assessed on a case-by-case basis in consultation with the RCDC.</li> </ul> <p><b>B. Contact Management</b></p> <p>Contacts and parents of contacts should be instructed about disease transmission as well as signs and symptoms of pertussis so that early diagnosis and treatment can be initiated when needed.</p> <p>All contacts should be assessed for symptoms of pertussis. Symptomatic contacts should be referred for clinical assessment and testing.</p> <p><b>Immunization</b></p> <p>The pertussis immunization status of all contacts should be reviewed and pertussis-containing immunization should be provided if the contact is not up-to-date. This includes contacts with a history of pertussis infection because past infection with pertussis is not a guarantee of immunity.</p> <p><b>Chemoprophylaxis</b></p> <p>There is no evidence that antibiotic prophylaxis of contacts changes the epidemic course of pertussis in the community, however all contacts should be followed up and assessed taking into account the definitions for vulnerable individuals, exposure and contacts. Additional risk groups may be identified for prophylaxis during an outbreak or at the discretion of the CMOH.</p> <p>Vulnerable individual: see definition in Case section.</p> <p><b>Contacts for whom chemoprophylaxis is recommended:</b></p> <p>Chemoprophylaxis is recommended for the following high-risk contacts regardless of immunization status or age:</p> <ul style="list-style-type: none"> <li>• All pregnant women in their third trimester</li> <li>• All infants &lt;1 year of age</li> <li>• Immunocompromised individuals</li> <li>• All household contacts IF there is a pregnant women in the third trimester or an infant &lt;1 year of age in the household.</li> </ul> <p>Note: If the case is the only vulnerable person in the household, contact prophylaxis is not indicated for the other household members.</p> |

## Approval

Approved by Dr. Kim Barker, Chief Medical Officer of Health on August 8, 2016.

## 7.6.5 Pertussis Outbreak Management Protocol

### Special Precautions/Considerations

Precautions: Droplet

#### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

|                                      |                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Pertussis Outbreak Definition</b> | One or more laboratory confirmed cases of pertussis in a community while there is ongoing Pertussis activity in the Territory and as declared by the CMOH.<br><br>The community outbreak will be declared over by the CMOH after 5 weeks with no new cases or at the discretion of the CMOH. Revert to the regular Pertussis Protocol in the CDC Manual at that time. |
| <b>Infectious Agent</b>              | Pertussis is an acute bacterial infection of the respiratory tract caused by <i>Bordetella pertussis</i> .                                                                                                                                                                                                                                                            |

|                              | Stage 1: Catarrhal                                                      | Insidious onset runny nose, possible fever and mild, occasional cough (which gradually becomes more severe).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Usually 7-10 days (range 4-21 days) |
|                              | Stage 2: Paroxysmal                                                     | <p>Paroxysms of numerous, rapid coughs due to difficulty expelling thick mucous from the tracheobronchial tree; each series has many coughs without intervening inhalation and can be followed by characteristic high-pitched inspiratory "whoop". Paroxysms frequently end with expulsion of clear, tenacious mucous, often followed by vomiting and exhaustion or periods of apnea.</p> <p>Paroxysmal attacks:</p> <ul style="list-style-type: none"> <li>• Occur frequently at night, with an average of 15 attacks per 24 hours.</li> <li>• Increase in frequency during the first 1-2 weeks, remain at the same frequency for 2-3 weeks and then gradually decrease.</li> </ul> <p>In infants less than 6 months of age, partially vaccinated children, adolescents and adults, classical symptoms may not be present.</p> <p><b>Note:</b> the previous outbreak and recently published evidence confirms that a significant number of pertussis cases DO NOT develop classic paroxysmal attacks. In an outbreak setting cough for more than 1 week should be enough to raise suspicion of pertussis.</p> | Usually 1-6 weeks                   |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                            |                                                                                              |                                            |

| Stage 3:<br>Convalescent | Gradual recovery with possible setbacks;<br>cough becomes less paroxysmal and<br>disappears.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | May persist<br>up to 10 weeks<br>or longer |                                                                                              |                                            |
| <b>Diagnostics</b>       | <p>Nasopharyngeal (NP) specimens are tested for <i>Bordetella pertussis</i> by PCR. Following your regional lab procedures, use the specimen collection kit that is specific for pertussis. Ensure an adequate quantity of testing kits are available throughout the outbreak. Note* pertussis testing kits have a short expiry date, manage accordingly.</p> <p>Testing for <i>Bordetella pertussis</i>:</p> <p>If any patient presents with symptoms suspicious of pertussis (at a minimum running nose and cough, with or without fever) swab prior to treatment.</p> <ul style="list-style-type: none"><li>• Use the metal NP swab in the pertussis collection kit or alternatively you may use a thin, nylon soft tipped swab. Insert the swab into the pertussis media for PCR testing. Indicate on the Dynacare requisition testing is for <i>Bordetella pertussis</i>.</li><li>• Do not collect a pertussis swab on <i>untreated</i> patients if it is <i>more than 4 weeks</i> after onset of illness. Do not collect a swab on <i>treated</i> patients if they have been on treatment for more than 1 week.</li><li>• You may collect a swab if they have been on treatment less than 1 week.</li><li>• Do not collect an NP swab in the same room where pertussis containing vaccine is being given as it may render a false positive result. The pertussis PCR test is very sensitive</li></ul> <p><b>Testing for other respiratory viruses during the respiratory season</b></p> <p>RSV, influenza and other viruses may also be circulating in the region. Per CMOH recommendation you may also be directed to collect swabs for a full respiratory viral panel preferably within 72 hours of symptom onset. This will provide a clearer diagnosis in an outbreak situation as other respiratory viruses may be circulating. If patients present with respiratory symptoms that do not fit the pertussis profile, do a random sampling of these ill cases using a regular NP swab, then submit those specs for a Respiratory Direct Viral Panel</p> <p>Please continue to follow any of the testing recommendations per the disease specific CD protocols, unless directed differently by the CMOH.</p> <p>Once you know what is circulating in your community (e.g. RSV or influenza) you no longer need to collect further respiratory panel specimens unless:</p> <ul style="list-style-type: none"><li>• You are directed to collect a NP specimen by your community physician for clinical management reasons</li><li>• You notice a difference in the clinical presentation of respiratory cases, and think something new is circulating.</li><li>• You are directed to collect further specimens by the CMOH.</li></ul> <p>Tips for NP swab for respiratory viral panel (RSV, influenza A and B etc.)</p> <ul style="list-style-type: none"><li>• Use the regular, larger tipped swab in adults and children who can tolerate it.</li><li>• For infants and toddlers, naso-pharyngeal aspirate may be collected in a sterile container and the bigger swab tip may then be dipped in the aspirate, and inserted into the pink viral media. Indicate on the</li></ul> |                                            |                                                                                              |                                            |

Adults and adolescents are considered to play a major role in the transmission of infection to infants and children.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                   |        |          |              |                                                                                                                                                                                                                                                                                            |  |                |                                                                                                                                                          |                               |                                                   |                                                                                                                              |                                   |

| <b>Communicability</b>                            | Pertussis is highly communicable from the start of the catarrhal stage until up to 21 days after the onset of cough, with a secondary attack rate of 80-90% among susceptible household contacts. It is most communicable in the early catarrhal stage and the beginning of the paroxysmal stage (i.e. the first 2 weeks of infection). Communicability then decreases and becomes negligible about 3 weeks after the onset of typical paroxysms in untreated individuals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                   |        |          |              |                                                                                                                                                                                                                                                                                            |  |                |                                                                                                                                                          |                               |                                                   |                                                                                                                              |                                   |

|                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Approval</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Approved by Dr. Michael Patterson, Chief Medical Officer of Health on December 02, 2019.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Fill out this sheet for anyone you think may have pertussis. For further details see the Pertussis Outbreak Management Protocol.

Case ID: \_\_\_\_\_

**First**, Check off all characteristics that apply to the case:

- ☐ A. Lab positive or indeterminate result (PCR)
- ☐ B. Contact with a lab confirmed case
- ☐ C. Cough >2 weeks
- ☐ D. Paroxysmal cough of any duration
- ☐ E. Cough with inspiratory whoop
- ☐ F. Cough ending in vomiting, gagging, or apnea
- ☐ G. Runny nose and mild cough
- ☐ H. No other known cause for the above symptoms

**Second**, follow the algorithm to decide what case definition fits and determine whether to test, treat, and do contact follow up:

- ☐ **A**  
*AND*  
one or more  
of **C, D, E, F**

- B**  
*AND*  
one or more  
of **D, E, F**

- ☐ **C**  
*AND*  
one or more  
of **D, E, F**  
*AND H*

- ☐ One or more of **D, E, F AND H**

- ☐ **G**  
with or  
without **B**

## Confirmed case

## Probable case

## Suspect case

### Possible case

- ❑ **Do not test/retest**
- ❑ **Treat** if symptom onset in last 21 days
- ❑ School/work exclusion (assess case by case with RCDC)

- ☐ **Test**
- ☐ **Treat** if symptom onset in last 21 days
- ☐ School/work exclusion (assess case by case with RCDC)

- ☐ **Test.**
- ☐ **Do not treat** unless lab comes back (+) or is prophylaxed as a contact
- ☐ If lab (-), reassess \_\_\_\_\_ for symptoms
- ☐ Do not report unless (+)
- ☐ Do not follow up contacts unless (+)

- ☐ Follow up contacts using *Pertussis Contact Management Worksheet*
- ☐ Ensure immunization is UTD
- ☐ **Send case report form and copy of immunization record to RCDC**

Use this sheet for **Confirmed, Probable, and Suspect** cases of pertussis to determine what management is required for their contacts.

Case ID: \_\_\_\_\_

**First**, identify contacts at home, school, daycare etc. who were exposed during the case's infectious period<sup>1</sup>. Contact tracing for prophylaxis is only useful if it has been less than 21 days since first exposure.

Exposure includes:

- Face to face contact for > 5 minutes
- Shared the same confined air space for > 1 hour
- Direct contact with respiratory secretions of the infected person

Vulnerable contacts include:

- Infants <1 year
- Pregnant women  $\geq 26$  weeks
- Immunocompromised

<sup>1</sup> Infectious period is from start of catarrhal stage (cold-like symptoms) until up to 21 days after cough onset, if untreated. Treated cases are non-infectious after 5 days of treatment.

<sup>2</sup>Look for vulnerables in the classroom ONLY for schools. For daycares, look at ALL children attending.

**If unsure of any steps, contact your RCDC.**

December 2016 (Reviewed December 2019)

## Quick Guide to Pertussis Immunization During Increased Pertussis Activity in Nunavut

Refer to the Nunavut Immunization Guide for specific information (e.g. precautions, contraindications etc.) on pertussis containing vaccines.

### Key Points

- There is pertussis activity in Nunavut communities at this time.
- During periods of increased pertussis activity, emphasis needs to be put on ensuring all Nunavummiut are appropriately immunized against pertussis with highest priority given to vulnerable individuals.
- Individuals vaccinated previously with acellular pertussis containing vaccine show waning immunity.
- Pertussis containing vaccines are very safe.
- The table below is divided into priorities for all communities given the current outbreaks in some communities.
- In addition, communities with ongoing outbreaks must do additional immunization.

| <b>ELIGIBILITY for Pertussis containing vaccine<br/>ALL NUNAVUT COMMUNITIES</b> |                                                                                |                                                                           |
|---------------------------------------------------------------------------------|--------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| <b>Age or category</b>                                                          | <b>Schedule</b>                                                                | <b>Comment</b>                                                            |
| Infants 2,4,6, and 18 mos.                                                      | As per Nunavut Recommended Schedule.                                           | Put emphasis on ensuring infant immunizations are up to date and on time. |
| 4 to 6 yr olds at school entry                                                  | As per Nunavut Recommended Schedule.                                           | Give as soon as eligible.                                                 |
| Grade 6<br>School based                                                         | As per Nunavut Recommended Schedule.                                           | Give as soon as eligible.                                                 |
| Under-immunized children under 18                                               | Refer to Nu. Imm. catch-up aid for children up to 18 years                     |                                                                           |
| Pregnant women in 3 <sup>rd</sup> trimester                                     | Tdap early in the 3 <sup>rd</sup> trimester of each pregnancy ( ≥ 26 weeks)    | This is designed to protect newborns.                                     |
| All adults > 18                                                                 | Single dose of pertussis containing vaccine as an adult regardless of last Td. |                                                                           |

### Immunization Priority in all Nunavut Communities

### **Groups at highest priority for immunization**

1. Pregnant women early in the 3rd trimester ( $\geq 26$  weeks). Note: Do not repeat in the 3<sup>rd</sup> trimester if the pregnant women was immunized in the 1<sup>st</sup> and 2<sup>nd</sup> trimester.
2. Household contacts of pregnant women in the 3<sup>rd</sup> trimester (up to date as per regular schedule).
3. All children 18 months and under (up to date and on time with primary series and booster).
4. Immune compromised individuals
5. Health Care Workers
6. All preschoolers
7. Grade 6 students
8. Medical travellers
9. Sports teams especially if going to a community with an outbreak.

Others in the community can be immunized opportunistically when they present to the Health Centre for another reason or as time permits.

### **Priority in Outbreak Communities**

In addition to the priorities for all communities, ensure the following are up to date in outbreak communities.

- Pertussis cases
- All vulnerable contacts.
- All household contacts whether or not there is a vulnerable person in the household .

AND as resources permit:

- School classmates of a case
- Daycare contacts of a case

# Fact Sheet

## Pertussis Outbreak

### What is pertussis disease?

Pertussis or 'whooping cough' is a serious infection of the lungs and throat caused by pertussis bacteria (germs).

### How is it spread?

Pertussis spreads easily when an infected person coughs, sneezes or has close contact with others. Sharing food, cigarettes, or kissing someone with pertussis can put you at risk. Pertussis can spread to others during the early stages of the infection when symptoms are not severe until 3 weeks after the cough starts. Sick persons cannot spread pertussis once they have had 5 days of antibiotics.

### Who is at risk?

- Anyone can get pertussis.
- Infants less than 1 year are most at risk for severe illness.
- Pregnant woman who get sick with pertussis in their last 3 months of pregnancy could spread the infection to their newborn.
- Persons with weakened immune systems.

### What are the symptoms of pertussis?

- Pertussis starts like a common cold with symptoms such as sneezing, runny nose and mild cough, and mild fever. Symptoms usually start 7-10 days after becoming infected.
- Over the next 2 weeks, the cough can worsen into repeated, forceful coughs that may end in vomiting, gagging, difficulty breathing, or a funny 'whoop' sound. In babies, pertussis can cause trouble breathing.
- A pertussis cough may be severe, worse at night, and can last for weeks or months.

Most people will recover from pertussis, but some people, especially infants, can become very ill. Pneumonia and seizures can occur.

### What is the treatment?

Early diagnosis of pertussis and treatment with an antibiotic are important. Vulnerable close contacts at high risk of serious illness may also receive an antibiotic to prevent the disease. This includes: infants less than 1 year of age, pregnant women in the last 3 months of their pregnancy (to protect the newborn), people with weakened immune systems, as well as their household contacts. Your health care provider will help determine which cases and contacts should receive antibiotics.

Children and adults who have not completed their recommended pertussis immunizations will need the vaccine as soon as possible.

### How else can pertussis be prevented?

- Pertussis vaccine is the best prevention. Ensure pertussis vaccines for you and your family are up to date.
- Cough into your sleeve or tissue. Hand washing, especially after coughing and sneezing, and before and after caring for a sick person, will help prevent the spread of germs.
- Avoid sharing food, drinks, cigarettes or eating utensils, and toothbrushes.
- If you or your child develop symptoms of pertussis report to your health care provider.

## Éclosion de coqueluche

### La coqueluche, c'est quoi?

La coqueluche est une grave infection des poumons et de la gorge, causée par la bactérie *Bordetella pertussis* (un germe).

### Comment se transmet-elle?

Les personnes infectées peuvent facilement transmettre la coqueluche par la toux, les éternuements et des contacts rapprochés avec leur entourage. Il est risqué de partager de la nourriture avec une personne atteinte, de fumer avec elle la même cigarette ou de l'embrasser. La maladie est transmissible dès les premiers stades alors que les symptômes sont encore légers, et jusqu'à trois semaines après l'apparition de la toux. Après un traitement antibiotique de cinq jours, les personnes malades ne sont plus contagieuses.

### Qui est à risque?

- Personne n'est à l'abri.
- Les nourrissons de moins d'un an sont les plus à risque de contracter une forme grave de la maladie.
- Les femmes enceintes qui contractent la coqueluche à leur dernier trimestre de grossesse peuvent infecter leur bébé.
- Les personnes au système immunitaire affaibli.

### Quels sont les symptômes?

- La coqueluche commence comme un rhume ordinaire et est caractérisée par des éternuements, un écoulement nasal, une faible toux et une légère fièvre. En général, les symptômes se manifestent de sept à dix jours après l'infection.
- Dans les deux semaines suivantes, le rhume peut dégénérer en quintes de toux répétées et violentes qui s'accompagnent parfois de vomissements, de haut-le-cœur, d'une difficulté à respirer (entre autres chez les bébés) ou d'un son étrange.
- Parfois violente, la toux peut s'aggraver la nuit et durer des semaines ou des mois.

Les personnes infectées recouvreront la santé pour la plupart, mais d'autres, surtout les nourrissons, peuvent devenir très malades. Il y a des risques de pneumonie et de convulsions.

### Quel est le traitement?

Un diagnostic précoce et un traitement antibiotique rapide sont importants. Les personnes vulnérables ayant des contacts étroits avec une personne infectée peuvent aussi recevoir un traitement par prévention. Il s'agit des personnes courant de grands risques de souffrir d'une forme grave de la maladie, comme les nourrissons de moins d'un an, les femmes enceintes qui en sont à leur dernier trimestre (pour protéger le bébé), les personnes ayant un système immunitaire affaibli et celles qui vivent sous le même toit que la personne malade. Votre fournisseur de soins de santé vous aidera à déterminer qui doit prendre des antibiotiques.

Les enfants et les adultes n'ayant pas été vaccinés contre la coqueluche selon les recommandations devront le faire dès que possible.

# Fiche d'information

## Éclosion de coqueluche

### Quels sont les autres moyens de prévention?

- Le vaccin contre la coqueluche est le meilleur moyen de prévention. Assurez-vous que vos vaccins et ceux des membres de votre famille sont à jour.
- Toussez dans votre manche ou dans un mouchoir. Se laver les mains, surtout après avoir toussé et éternué ainsi qu'avant et après avoir pris soin d'une personne malade, contribue à prévenir la transmission des germes.
- Évitez de partager de la nourriture et des boissons ainsi que de mettre votre bouche en contact avec une cigarette, un ustensile ou une brosse à dents utilisés par une autre personne.
- Si vous ou votre enfant manifestez des symptômes de la coqueluche, signalez-le à votre fournisseur de soins de santé.

### BOX 1.3 – MEDEVAC AND HOSPITALIZATION HISTORY

| Type                                                                         | Date | Reason | Origin | Receiving facility | Date of discharge |
|------------------------------------------------------------------------------|------|--------|--------|--------------------|-------------------|
| <input type="checkbox"/> Hospitalization<br><input type="checkbox"/> Medevac |      |        |        |                    |                   |
| <input type="checkbox"/> Hospitalization<br><input type="checkbox"/> Medevac |      |        |        |                    |                   |
| <input type="checkbox"/> Hospitalization<br><input type="checkbox"/> Medevac |      |        |        |                    |                   |

### BOX 1.4 – IMMUNIZATION HISTORY

1. Please attach copy of immunization record to this form.

For RCDC: Was individual up to date for age with pertussis vaccinations at time of exposure to pertussis? ☐ Yes ☐ No

2. For children less than 1 year of age, please attach mother's immunization record OR indicate:

Was mother immunized for pertussis during the third trimester?

☐ Yes ☐ No ☐ Unknown

If yes, date of immunization: \_\_\_\_ (DD) \_\_\_\_ (MM) \_\_\_\_ (YYYY)

### BOX 1.5 – CONTACTS: Does the case have any contacts who are vulnerable individuals?

|                                                                                                      |                              |                             |
|------------------------------------------------------------------------------------------------------|------------------------------|-----------------------------|
| Contacts less than 1yr old?                                                                          | <input type="checkbox"/> Yes | <input type="checkbox"/> No |
| Contact who is pregnant and in their 3 <sup>rd</sup> trimester?                                      | <input type="checkbox"/> Yes | <input type="checkbox"/> No |
| Contact who is immune-compromised? (on chemotherapy or a medication known to inhibit immune system)? | <input type="checkbox"/> Yes | <input type="checkbox"/> No |

### BOX 1.6 – NOTES

|                           |      |              |
|---------------------------|------|--------------|
|                           |      |              |
| Name of person reporting: | Tel: | Report date: |

**Fax completed form to the Regional CDC  
within 24 hours, update as necessary:**

### Exposure includes:

- Face to face contact for > 5 minutes
- Shared the same confined air space for > 1 hour
- Direct contact with respiratory secretions of the infected person

### Vulnerable individuals:

- Infants < 1year of age
- Pregnant women in the 3<sup>rd</sup> trimester
- Immunocompromised individuals

### Household contacts:

- All individuals who live in the home including attendees at family day/care
- Individuals who visit the household daily.

## Laboratory Testing for Bordetella Pertussis

**If any patient presents with symptoms suspicious of pertussis - swab prior to treatment.**

**Step 1** – Use the Nasopharyngeal swab provided in the *Bordetella Pertussis Testing Kit*

This kit is not the same as the one used for a viral respiratory panel. Both tests are indicated for a client presenting with symptoms of pertussis. Please see the *Nunavut Pertussis Outbreak Protocol* for further details.

**Step 2 – Take swab.**

Do not collect an NP swab in the same room where pertussis containing vaccine is being given as it may render a false positive result.

**Step 3** - Insert the swab into the pertussis media for PCR testing.

### Step 4 – Fill out the requisition

Include client name, date of birth, provider name and community name - Indicate on the requisition that testing is for Bordetella Pertussis.

## Step 5 – Report

**Pertussis is a reportable infection in Nunavut.** Notify the regional Communicable Disease Coordinator or Chief Medical Officer of Health on call with any suspect, probable, or confirmed cases within 24 hours. CMOH on call: 867-975-5772.

| <b>Infectious Agent</b>      | Poliovirus, of the genus Enterovirus. There are three types: Types 1, 2 and 3; all types can cause paralysis, though Type 1 is most often associated with Poliomyelitis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Clinical Presentation</b> | <p>Poliomyelitis (Polio) is an acute viral illness, ranging from sub-clinical infection to paralytic disease. Over 90% of cases are asymptomatic or may have only fever. Symptoms of minor illness include fever, headache, malaise, nausea and vomiting. If disease progresses to major illness, there may be severe muscle pain and stiffness of the neck and back with flaccid paralysis.</p> <p>The most characteristic feature of polio paralysis is asymmetric distribution, which affects some muscle groups while sparing others.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Diagnostics</b>           | <p>The following are considerations to confirm Polio:</p> <ul style="list-style-type: none"> <li>• All suspected cases of Polio should have a throat swab and CSF submitted for viral isolation.</li> <li>• Collection of one stool sample within two weeks (up to 6 weeks) after the onset of paralysis for viral studies. A rectal swab is acceptable in the absence of a stool sample.</li> <li>• Serum specimen should be collected immediately for polio serology.</li> <li>• In the absence of a positive culture, acute and convalescent neutralizing antibody titres can be examined to detect a fourfold rise indicative of infection. In some cases these antibodies may already be present at the time of paralysis and no rise is demonstrated.</li> <li>• A second serum specimen should be collected two weeks later if the patient presents in the acute phase of the illness or one month later if the patient presents in the convalescent phase. Samples should be tested in parallel for poliovirus antibody titres and polio-specific IgG and IgM evaluations.</li> <li>• All samples may be forwarded to the National Centre for Enteroviruses for further investigation when needed, i.e., to determine whether the virus is wild-type or vaccine strain.</li> <li>• Neurologic investigations should take place (electromyography, nerve conduction studies, MRI, CT).</li> </ul> <p>Follow your regional laboratory procedures for testing.</p> |
| <b>Treatment</b>             | Supportive treatment as indicated. Attention to respiratory needs of those with severe illness.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Occurrence</b>            | <p><b>Worldwide:</b> Polio cases have decreased by over 99% since 1988; the reduction is the result of a global effort to eradicate the disease. In 2012, only three countries (Afghanistan, Nigeria and Pakistan) remain polio-endemic, down from more than 125 countries in 1988.</p> <p><b>Canada:</b> Canada was certified polio-free in 1994. One of the conditions of the certification was to establish a surveillance system for the identification of Acute Flaccid Paralysis (AFP). Active surveillance for AFP continues. This data</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Infectious Agent</b>      | Rubella virus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Clinical Presentation</b> | <p>Rubella is most often a mild viral illness associated with rash in approximately half of infections. Asymptomatic infections occur.</p> <p>Generally, a prodrome occurs 1-5 days before the onset of rash which may be characterized by low-grade fever, headache, mild coryza, malaise and conjunctivitis. Children usually have few or no symptoms. Lymphadenopathy, involving occipital, post auricular and posterior cervical nodes, may start 5-10 days prior to the rash onset and is the most characteristic sign. Transient arthralgia and, less frequently, arthritis may occur in up to one-third of women and usually begins at the same time as the rash or shortly afterwards.</p> <p>The rash is diffuse, punctate (red pinpoint), and maculopapular. It is often itchy and begins on the face. The usual duration is 3-5 days. Clinically, Rubella is indistinguishable from febrile rash illnesses caused by measles, parvovirus B19, human herpes virus 6 (HHV6), Coxsackie virus, ECHO virus, adenovirus and dengue virus, and laboratory confirmation is required for diagnosis unless there is an epidemiological link to a confirmed case.</p> <p>Rare complications include chronic arthritis and encephalitis in adults, and thrombocytopenia in children.</p> <p>Rubella is important because of its ability to produce anomalies in the developing fetus if the infection is acquired in the first trimester of pregnancy (refer to Section 7.9.1 Congenital Rubella protocol).</p> |
| <b>Diagnostics</b>           | <p>The clinical diagnosis of Rubella is often difficult as Rubella has many symptoms in common with other rash illnesses.</p> <p>IgM antibodies develop about 5 days post rash onset. IgM antibodies can persist for 6 weeks after the rash onset. If the IgM is negative and the sample has been taken on or before the fifth day post rash onset, another specimen should be taken as soon as possible (more than 5 days post rash onset).</p> <p>Seroconversion or a significant rise in rubella IgG between acute and convalescent sera collected at least 10 days apart will assist with the diagnosis of infection.</p> <p>Isolation of rubella virus from the nose, throat, cerebral spinal fluid, urine or blood can be used to confirm the diagnosis. Ideal specimens are respiratory (nasopharyngeal or throat swabs). Specimens should be obtained as soon as possible after onset (less than 4-5 days post onset).</p> <p>Follow your regional laboratory procedures for testing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Treatment</b>             | Supportive treatment as indicated. No specific treatment is available for Rubella.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Occurrence</b>                    | <p><b>Worldwide:</b> Worldwide occurrence. Rubella occurs primarily in unimmunized groups. In many countries, sustained high levels of rubella immunization have drastically reduced or essentially eliminated Rubella and Congenital Rubella Syndrome.</p> <p><b>Canada:</b> The first laboratory-confirmed cases of Rubella in Canada were reported in 1924. Vaccine was introduced in 1969. Currently, approximately 2,000 cases are reported annually. Overall, 50–60% of reported cases occur among adolescents and young adults between the ages of 10 and 39 years.</p> <p><b>Nunavut:</b> There have been no reported cases since 2000.</p>                                                                                                                                                             |
| <b>Reservoir</b>                     | Humans                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Transmission</b>                  | Infection is transmitted by droplet spread and/or direct contact with nasopharyngeal secretions of infected individuals. Although rubella transmission is most often associated with repeated and prolonged exposure, transmission has been documented following a single exposure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Incubation Period</b>             | Average length is 14-17 days, however can be as long as 21 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Communicability</b>               | From 7 days before the onset of the rash until at least 4 days after rash onset. Rubella is a highly communicable disease and is most contagious when the rash is erupting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Susceptibility and Resistance</b> | <p>Universal susceptibility following the loss of acquired maternal antibodies (usually 6-9 months). In closed environments all exposed susceptible individuals may become infected.</p> <p>Immunity is believed to be permanent after natural infection, and thought to be long-term, probably lifelong, after immunization. However, re-infection following successful immunization or natural disease has been reported, especially in outbreak situations. The vast majority of these re-infections is asymptomatic and rarely lead to Congenital Rubella.</p> <p>Most individuals born in Canada before 1970 can be considered immune as they have likely been infected naturally.</p>                                                                                                                     |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Case</b>                          | <p>Confirm the diagnosis – ensure that all suspect cases receive prompt investigative procedures to confirm the case. Contact and interview the case or guardian.</p> <p>Case management is critical to prevent Congenital Rubella Syndrome and Congenital Rubella Infection. Complete the <a href="#">Vaccine Preventable Disease Report Form</a> dated March 2014 or later (section 7.8.2).</p> <p>Infected individuals should be excluded from school, childcare or work until 7 days after the appearance of the rash. Isolation of the infected individual is important so as not to infect those who may be susceptible. Infected individuals should be advised to avoid contact with pregnant females and should be questioned regarding known contact with pregnant females (see Contacts section).</p> |
| <b>Contacts</b>                      | <p>A contact of a Rubella case is any susceptible person who has had close contact with the case during the period of communicability.</p> <p><b>Susceptible contacts:</b><br/>The following individuals are considered susceptible:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Infectious Agent</b>      | Rubella virus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Clinical Presentation</b> | <p>Congenital Rubella Infection (CRI) occurs when the rubella virus is passed from an infected pregnant mother to her baby.</p> <p>Fetal infections with rubella, especially in the first 20 weeks of pregnancy, may be associated with spontaneous abortion, intrauterine death and a variety of other problems collectively known as Congenital Rubella Syndrome (CRS), which can occur as single or combined defects. Clinically compatible manifestations of Congenital Rubella:</p> <ol style="list-style-type: none"> <li>1. Cataracts or congenital glaucoma</li> <li>2. Congenital heart defect</li> <li>3. Sensorineural hearing loss</li> <li>4. Pigmentary retinopathy</li> <li>5. Purpura</li> <li>6. Hepatosplenomegaly</li> <li>7. Microcephaly</li> <li>8. Microphthalmia</li> <li>9. Mental retardation</li> <li>10. Meningoencephalitis</li> <li>11. Radiolucent bone disease</li> <li>12. Developmental or late onset conditions such as diabetes and progressive panencephalitis</li> </ol> <p>Moderate and severe cases of CRS are typically recognized at birth. In mild forms of the disease, however, the anomalies may not be obvious at birth but may become apparent within the first year of life.</p> <p>The risk of infection producing damage to the fetus evident at birth is as high as 90% if infection occurs in the first trimester, falling to 10-20% by the 16<sup>th</sup> week, and becoming very low by the 20<sup>th</sup> week of pregnancy and beyond. Diabetes mellitus has been recognized as a frequent late manifestation of CRS.</p> |
| <b>Diagnostics</b>           | <p>Laboratory confirmation of CRI/CRS is done by:</p> <ul style="list-style-type: none"> <li>• Isolation of rubella virus from an appropriate clinical specimen</li> <li>• Positive serologic test for rubella-specific IgM in the absence of recent immunization with rubella-containing vaccine</li> <li>• Detection of rubella virus RNA (e.g. PCR) in an appropriate clinical specimen</li> <li>• Rubella-specific IgG persisting for longer than would be expected (approximately six months following birth) from passive transfer of maternal antibody, or in the absence of recent immunization.</li> </ul> <p>For a diagnosis of CRS, the infant must also have two clinically compatible manifestations as outlined in Clinical Presentation section. Often cases of CRS are diagnosed long after birth as clinical manifestations become apparent. For this reason there is no time limit for the diagnosis and reporting of CRS.</p> <p>Follow your regional laboratory procedures for testing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Treatment</b>                     | Supportive treatment as indicated. No specific treatment is available for Congenital Rubella.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Occurrence</b>                    | <p><b>Worldwide:</b> In many countries, sustained high levels of rubella immunization have drastically reduced or essentially eliminated rubella and CRS.</p> <p><b>Canada:</b> Rubella vaccine was licensed in Canada in 1969, and since that time, the number of Congenital Rubella cases has decreased dramatically. CRI/CRS is a disease under national surveillance. The number of pregnant women who are susceptible to rubella varies significantly across provinces and territories. This may be due to provincial/territorial immunization practices before 1983 when Measles, Mumps, Rubella (MMR) immunization of children 12-15 months became routine in all provinces/territories as well as the rubella immunization status in immigrant women.</p> <p><b>Nunavut:</b> No reported cases in Nunavut since 2000.</p>                                                                                                                                                        |

| <b>Transmission</b>                  | The virus is transmitted through the mother's blood infecting the placenta and the fetus. Infection in the first 20 weeks of gestation is most often associated with CRS and congenital defects. Infection after the first 20 weeks is most often associated with CRI. When maternal infection occurs after the 20 <sup>th</sup> week of gestation, congenital defects are rare.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Approval</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                    |
| Approved by Dr. Maureen Baikie, Chief Medical Officer of Health on January 2, 2014.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                    |

## 7.10 Smallpox

### Special Precautions/Considerations

Precautions: Droplet, Direct and Indirect Contact

#### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

|                                                           |                                                                                                                                                                                                                                                                                |
|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Infectious Agent</b>                                   | The variola virus, a species of Orthopoxvirus. In 1979 the World Health Organization declared that Smallpox (variola) had been successfully eradicated worldwide, however it does remain as a potential bioterrorism weapon.                                                   |
| <b>Clinical</b>                                           |                                                                                                                                                                                                                                                                                |
| <b>Clinical Presentation</b>                              | See Clinical Illness in the Case Definition section.                                                                                                                                                                                                                           |
| <b>Diagnostics</b>                                        | Consult your regional laboratory.                                                                                                                                                                                                                                              |
| <b>Treatment</b>                                          | Consult with a physician.                                                                                                                                                                                                                                                      |
| <b>Pathogen</b>                                           |                                                                                                                                                                                                                                                                                |
| <b>Occurrence</b>                                         | Smallpox formerly occurred worldwide but has been eradicated; the last known human cases were reported in 1978.                                                                                                                                                                |
| <b>Reservoir</b>                                          | Humans; no known animal or environmental reservoir. Currently, the virus is maintained only in two WHO-designated laboratories.                                                                                                                                                |
| <b>Transmission</b>                                       | Person-to-person. Infection usually occurred via the respiratory tract via droplets or skin inoculation. The conjunctiva or the placenta were occasional portals of entry.                                                                                                     |
| <b>Incubation Period</b>                                  | From 7-19 days; commonly 10-14 days to onset of illness and 2-4 days more to onset of rash.                                                                                                                                                                                    |
| <b>Communicability</b>                                    | From the time of development of the earliest lesions to disappearance of all scabs (approximately 3 weeks). The risk of transmission appears to have been highest at the appearance of the earliest lesions through droplet spread from the oropharynx of the infected person. |
| <b>Susceptibility and Resistance</b>                      | All unvaccinated individuals are susceptible.                                                                                                                                                                                                                                  |
| <b>Public Health Management</b>                           |                                                                                                                                                                                                                                                                                |

The rash consists of deep, firm, well-circumscribed pustules that are mostly all in the same stage of development. The lesions are characteristically umbilicated. The lesions initially appear as macules, evolving into papules, vesicles and then pustules in a matter of days. Finally, crusted scabs form; they then fall off several weeks after the initial appearance of the rash. Lesions initially appear in the oral mucosa/palate and then progress in a centrifugal pattern to involve the face, arms, legs, palms and soles. Atypical presentations include flat velvety lesions that do not evolve into pustules and more severe forms with confluent or hemorrhagic lesions.</p> <p><b><u>Atypical presentations of smallpox include:</u></b></p> <p>Haemorrhagic lesions OR flat velvety lesions not appearing as typical vesicles nor progressing to pustules.</p> |

## **Approval**

Approved by Dr. Maureen Baikie, Chief Medical Officer of Health on January 2, 2014.

## 7.11.1 Tetanus

### Special Precautions/Considerations

Precautions: Routine

#### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Infectious Agent</b>      | <i>Clostridium tetani</i> , the tetanus bacillus, is a gram-positive spore-forming bacillus that produces a potent neurotoxin.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Clinical Presentation</b> | <p>Characterized by acute onset of hypertonia and/or painful muscular contractions (usually of the muscles of the jaw and neck), and generalized muscle spasms without apparent medical cause.</p> <p>Neonatal Tetanus, arising from contamination of the umbilical cord, is a common cause of infant mortality in developing countries. This generally results from a lack of passive immunity, that is, the mother being inadequately immunized. Clinical manifestations include generalized weakness and failure to nurse. Apnea is the most prominent cause of death in the first week of life and sepsis in the second week. Rigidity and spasms occur later in survivors.</p> <p>Complications from Tetanus include laryngospasm and spasm of the respiratory muscles interfering with breathing. Fractures of the spine or long bones may occur as a result of sustained contractions and convulsions. Aspiration pneumonia is a common late complication occurring in more than half of autopsied cases. The case-fatality rate ranges from 10 to over 80%, depending on age and quality of care available.</p> |
| <b>Diagnostics</b>           | <p>History of injury or portal of entry may not be apparent. The organism is rarely recovered from the site of infection; therefore, culturing infected wounds is not generally helpful. The diagnosis is generally made based on symptoms.</p> <p>There is no diagnostic laboratory test for Tetanus.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Treatment</b>             | <p>As directed by a physician. If Tetanus is suspected, contact your Regional Communicable Disease Coordinator (RCDC) immediately.</p> <p>Refer to the Tetanus and Tetanus Immune Globulin prophylaxis protocols in the Nunavut Immunization Manual.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Occurrence</b>            | <p><b>Worldwide:</b> There is worldwide occurrence with approximately 50,000 deaths annually but disease is relatively uncommon in industrialized countries. Tetanus is more common in agricultural regions and in underdeveloped areas where immunization may not be adequate and there may be contact with animal feces. Tetanus is an important cause of death in rural and tropical areas in countries of Asia, Africa, and South America. Neonatal Tetanus accounts for approximately 50% of all tetanus deaths in developing countries. The worldwide tetanus mortality rate is approximately 50%, with the highest rates in the young, the elderly, and injection drug users.</p> <p><b>Canada:</b> Tetanus is rare in Canada. The number of cases reported annually ranged from 1–7 (average 5) from the years 1990 to 2000. The immunization status of most cases was unknown. Males over the age of 50 years accounted for the majority of reported cases.</p> <p><b>Nunavut:</b> No reported cases.</p>                                                                                                      |

|                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reservoir</b>                                          | The organism is a normal member of intestinal flora in animals and humans; the source of infection is soil or fomites contaminated with animal or human feces containing the spores which can contaminate wounds of all types. Tetanus spores are ubiquitous in the environment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Transmission</b>                                       | Spores are introduced into the bloodstream through wounds, lacerations or punctures that have been contaminated with soil, street dust or the feces of animals or humans. Spores are also transmitted into the body by contaminated street drug paraphernalia and contaminated skin.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Incubation Period</b>                                  | Usually 3-21 days, with a range from 1 day to several months. The average incubation period is 10 days; most cases occur within 14 days of exposure. In general, shorter incubation periods are associated with more heavily contaminated wounds, more severe disease and a worse prognosis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Communicability</b>                                    | No direct person-to-person transmission.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Susceptibility and Resistance</b>                      | <p>Tetanus is a vaccine preventable disease; susceptibility is general in unimmunized or inadequately immunized persons. Active immunity is induced by the tetanus toxoid and persists for at least 10 years after full immunization. In order to maintain high levels of immunity, booster doses are required every 10 years.</p> <p>Recovery from tetanus infection may not result in immunity; second episodes can occur and primary immunization is indicated after recovery.</p>                                                                                                                                                                                                                                                                                                                                      |
| <b>Public Health Management</b>                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Case</b>                                               | <p>Confirm the diagnosis – ensure that all suspect cases receive prompt investigative procedures to confirm the case. Contact and interview the case, parent or guardian. Complete the <a href="#">Vaccine Preventable Disease Report Form</a> dated March 2014 or later (section 7.11.2).</p> <ol style="list-style-type: none"> <li>1. Treatment of clinical cases should not be delayed until laboratory confirmation. Treatment is under the direction of the attending health care provider in consultation with an infectious disease specialist.</li> <li>2. Once recovered, persons with incomplete or no immunization should receive a complete primary series of tetanus-containing vaccine (or booster dose) according to the Nunavut publicly funded immunization schedule and the age of the case.</li> </ol> |
| <b>Contacts</b>                                           | No follow up is required; Tetanus is not transmitted person-to-person.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Outbreaks</b>                                          | Rare. | <b>Infectious Agent</b>      | Varicella is caused by the varicella zoster virus (VZV), a member of the <i>Herpes virus</i> group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Clinical Presentation</b> | <p>Varicella (chickenpox) is an acute disease characterized by a pruritic (itchy) vesicular rash. The rash progresses rapidly from macules to vesicles to pustules and scabs over within a few days. Lesions appear in successive crops over 5 to 6 days following rash onset and are more abundant on the trunk, but are sometimes present on the scalp, mucous membranes of the mouth, respiratory tract, conjunctiva and rectal and vaginal mucosa. Lesions are pruritic and if infected cause scarring. The illness may or may not have a prodromal period which may include fever, malaise and upper respiratory tract infection.</p> <p>Varicella is generally considered a mild disease, however, 5-10% of otherwise healthy children develop complications that may be fatal. Complications may include secondary bacterial infections, soft tissue infections, otitis media, bacteremia, pneumonitis, osteomyelitis, septic arthritis, endocarditis, necrotizing fasciitis, toxic shock-like syndrome, hepatitis, thrombocytopenia, cerebellar ataxia and encephalitis.</p> <p>The risk of severe invasive group A streptococcal infection has been estimated at 40-60 times higher among previously healthy children with varicella. Adolescents, adults or immunocompromised hosts are more likely to have complications such as pneumonia, encephalitis, and death, with a case fatality rate 10-30 times higher than in children. In both adults and children, the majority who die from complications of varicella have no identifiable risk factor for severe disease.</p> <p>Maternal varicella occurring in the 5 days before to 2 days after birth may result in overwhelming infection of the neonate and a fatality rate as high as 30%.</p> <p>Recurrences of varicella-like rash have been reported by 4-13% of people who had previous varicella infection. Risk factors include having a first infection at a young age (less than 12 months of age) or having a mild first infection.</p> <p>The virus remains latent and may recur years later as herpes zoster (shingles). Exactly how the virus remains latent in the body and subsequently reactivates is not clearly understood.</p> <p>Breakthrough disease is defined as a case of wild-type varicella occurring after exposure to wild-type virus, more than 42 days following vaccination. A breakthrough infection is usually mild. Rash is frequently atypical, predominantly maculopapular with fewer than 50 skin lesions. There is a lower rate of fever and faster recovery. Vaccine recipients with mild breakthrough disease are approximately one-third as contagious as unimmunized children.</p> |
| <b>Diagnostics</b>           | The diagnosis of varicella has been most often made clinically by the health care provider through patient history and physical examination. Confirmation of disease is done by taking a lesion swab/scraping from                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                                      | <p>the base of a fresh vesicular lesion and serology for VZV IgM and IgG. An IgM positive result may indicate an acute VZV infection. Seroconversion for VZV IgG may indicate a recent acute VZV infection; however, note that immunized and immunocompromised individuals may not develop a detectable VZV IgG response.</p> <p>Follow your regional laboratory procedures for testing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Treatment</b>                     | Supportive treatment as indicated. Consult with physician as needed. In persons under the age of 18 years, avoid the use of acetylsalicylic acid (ASA, Aspirin) because of the association with Reye's syndrome.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Occurrence</b>                    | <p><b>Worldwide:</b> Worldwide occurrence. In temperate climates, at least 90% of the population have had varicella disease by the age of 15 years and at least 95% of the population by young adulthood. The disease occurs most frequently in winter and early spring. In tropical countries the epidemiology of the disease is quite different. In these areas a higher proportion of cases occur among adults.</p> <p><b>Canada:</b> The reporting of varicella across Canada is considered an underestimate of actual cases. In the pre-vaccine era the estimate was about 350,000 cases per year. The highest morbidity rates occur during the first year of life and after the age of 15. Varicella vaccine was licensed for use in Canada in December 1998.</p> <p><b>Nunavut:</b> The varicella vaccine was included in the Nunavut childhood immunization schedule in 2002. Case counts began to decline after 2006 but cases still occur every year.</p> |
| <b>Reservoir</b>                     | Humans                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Transmission</b>                  | Person-to-person by direct contact with VZV through droplet or airborne spread of vesicle fluid or secretions (including herpes zoster/shingles lesions) of the respiratory tract or indirectly by freshly contaminated fomites. Scabs are not infectious. Transmission during pregnancy to the fetus can also occur.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Incubation Period</b>             | From 10-21 days (range of 14-16 days). May be prolonged in the immunocompromised and after passive immunization against varicella (e.g. varicella-zoster immune globulin [VZIG]).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Communicability</b>               | As long as 5 days but usually 1-2 days before onset of symptoms and until the last lesions has crusted (usually about 5 days after the rash onset). The attack rate among susceptible contacts in household settings is estimated at 65-87%.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Susceptibility and Resistance</b> | Susceptibility is universal in persons not previously infected or vaccinated; infection usually confers lifelong immunity. The virus remains latent in sensory ganglia and disease may recur years later as herpes zoster (shingles) in about 15% of adults and sometimes in children.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Case</b>                          | <p>Uncomplicated individual cases (confirmed and probable) of varicella do not require public health management. Children with varicella in daycare, preschool, or school settings should be excluded from these settings until 5 days after the start of the rash. The case is considered low risk for transmission when the rash is: (1) covered, (2) has crusted, or (3) in immunized people without crusts, until lesions are resolving.</p> <p>In circumstances when an immunocompromised individual is present in a work, school or daycare setting, the immunocompromised individual should be</p>                                                                                                                                                                                                                                                                                                                                                           |

|                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                           | excluded (not the case) and referred to their health care provider (rationale: other individuals in the facility may be incubating varicella creating further potential exposures). This decision should be made on a case-by-case basis in consultation with the CMOH/DCMOH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Contacts</b>                                           | <p>Significant exposure to VZV is considered direct face-to-face contact with infected persons, or any direct contact with fluids from lesions or objects contaminated with this fluid (note that this also includes shingles lesions). Exposure to dried scabs from varicella or zoster lesions does not constitute significant exposure.</p> <p>A <b>varicella-immune individual</b> is any person with any one of the following:</p> <ul style="list-style-type: none"> <li>- self-reported history of varicella or herpes zoster</li> <li>- health care provider-diagnosed varicella or herpes zoster</li> <li>- documentation of positive VZV IgG</li> </ul>                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Outbreaks</b>                                          | If a higher than normal amount of disease activity is detected, contact your RCDC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 8.0 Infections Spread By Direct Contact

### Purpose

The purpose of this section of the Communicable Disease Manual is to provide guidelines for the investigation and management of individuals who have been diagnosed with notifiable infections spread by direct contact, including Group B Streptococcal Disease, Methicillin-Resistant *Staphylococcus aureus* (MRSA) and Viral Hemorrhagic Fevers.

### Legislation/Policy

Authority for the reporting of notifiable infections spread by direct contact and the public health management comes from the *Public Health Act, Communicable Disease Regulations*.

All clients who have been diagnosed with a notifiable infection spread by direct contact must be reported to the Chief Medical Officer of Health (CMOH).

All clients who are suspected to have or have a confirmed notifiable infection spread by direct contact are to be followed as per the protocols in this section.

### Roles and Responsibilities

**Table 8.1 Roles and responsibilities for follow-up of notifiable infections spread by direct contact**

| Role                                                                                         | Responsibilities                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Infectious Agent</b>      | Group B <i>Streptococci</i> ( <i>S. agalactiae</i> ), gram-positive cocci.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Clinical Presentation</b> | <p>Group B <i>Streptococcus</i> (group B strep, GBS) is a type of bacteria that causes illness in people of all ages. It is the most common cause of some life-threatening infections in newborns; two distinct forms of invasive illness can occur in infants:</p> <ul style="list-style-type: none"> <li>• Early onset disease (1 to 7 days after birth) characterized by sepsis, respiratory distress, apnea, shock, pneumonia and meningitis.</li> <li>• Late onset disease (7 days to several months after birth) characterized by bacteremia, meningitis and other focal infections. <b>Note that only illness up to 28 days after birth is notifiable.</b></li> </ul> <p>GBS is more likely to be fatal with early onset disease in comparison with late onset disease.</p> <p>The most common problems caused by GBS in adults are:</p> <ul style="list-style-type: none"> <li>• Bloodstream infections;</li> <li>• Pneumonia (infection in the lungs);</li> <li>• Skin and soft-tissue infections; and</li> <li>• Bone and joint infections.</li> </ul> <p>Rarely in adults, GBS can cause meningitis (infection of the fluid and lining surrounding the brain).</p> |
| <b>Diagnostics</b>           | <p>Laboratory Criteria for Diagnosis requires the isolation of <i>S. agalactiae</i> by culture from a normally sterile site (e.g. blood or cerebrospinal fluid or, less commonly, joint, pleural or pericardial fluid).</p> <p><b>It is essential to note that only invasive disease is reportable.</b></p> <p>Follow your regional laboratory procedures for diagnostic testing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Treatment</b>             | A discussion of the treatment of invasive GBS is beyond the scope of these guidelines. The case should be referred to an expert for further management.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Occurrence</b>            | <p><b>Worldwide:</b> GBS is thought to occur worldwide. It is estimated that between 10 to 30% of women are vaginally colonized with GBS; approximately 70% of offspring may be colonized postnatal, but only approximately 1 to 2% develop symptomatic infection.</p> <p><b>Canada:</b> Incidence in Canada and the United States has decreased with the introduction intrapartum chemoprophylaxis. There has been a dramatic decrease compared to the fatality rate of 70% three decades ago.</p> <p><b>Nunavut:</b> There have been 2 reported cases between 1999 and 2011, one case in a newborn and the other in an adult.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Transmission</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>Vertical transmission from mother to baby can occur in utero as a result of ascending infection. Additionally, if during delivery the neonate aspirates contaminated amniotic/vaginal fluid, or passes through the GBS-colonized birth canal, infection may occur. Risk is increased in infants delivered at &lt;37 weeks and/or when rupture of membranes occurs 18 hours prior to delivery.</p> <p>Once in the neonatal lung, it causes pneumonia. Sepsis results when the bacteria enter the bloodstream of the neonate. From there the bacteria can infect multiple neonatal organs, including the brain and heart. Late-onset disease is sometimes seen with strains of GBS that are not carried by the mother.</p> <p>The source of infection for adults is unknown. Since GBS is a common organism in the gastrointestinal tract of men and women, this may be a source of some infection.</p>                                                                                                                                                                                                                                                                                                                                                                                                                     |  |                       |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Approval

Approved by Dr. Maureen Baikie, Chief Medical Officer of Health on August 6, 2013.

## 8.2.1 Methicillin-Resistant *Staphylococcus aureus* (MRSA)

### Special Precautions/Considerations

Precautions: Direct and indirect contact precautions

#### Reporting

Notifiable: Yes

Reporting: Routine (within 7 days)

| <b>Infectious Agent</b>      | Initially, Methicillin-Resistant <i>Staphylococcus aureus</i> (MRSA) was recognized as a hospital pathogen, often called healthcare-associated MRSA. During the past ten years unique and genetically different MRSA strains have become more prevalent in communities (community-associated MRSA). However, the difference between healthcare- and community-associated MRSA has been largely lost in recent years.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Clinical Presentation</b> | The most frequently reported clinical presentation of MRSA is skin and soft tissue infections (SSTIs), particularly furuncles, carbuncles, and abscesses. The severity of SSTIs varies from mild superficial infections to deeper soft-tissue abscesses. Infections can also occur systemically (bacteremia), in bone and in other organs (e.g. lung). Recurrent MRSA skin infections and clustering of infections within a household are relatively common occurrences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Diagnostics</b>           | <p><b>When to consider MRSA:</b></p> <ul style="list-style-type: none"> <li>As a potential pathogen when assessing abscesses, pustular lesions, boils and cellulitis; or if there is severe illness compatible with <i>Staphylococcus aureus</i> (<i>S. aureus</i>) in cases of septicemia, osteomyelitis, necrotizing pneumonia, septic arthritis or necrotizing fasciitis.</li> <li>In areas where &gt;10-15% of community isolates of <i>S. aureus</i> are methicillin resistant (see section 8.2.2 for the most recent available information for your region).</li> <li>Suspect MRSA when there is a poor response to beta-lactam therapy in individuals with presumed staphylococcal infection.</li> </ul> <p>Culture and susceptibility testing is the current standard for MRSA diagnosis in Nunavut.</p> <p><b>Culture should be obtained for the following:</b></p> <ul style="list-style-type: none"> <li><b>Previous MRSA infection in a patient who now presents with an infection consistent with MRSA, and for whom antibiotic therapy is required.</b></li> <li>For suspected <i>S. aureus</i> infection which has not responded to initial therapy.</li> <li>For patients with two or more furuncles or abscesses within six months.</li> <li>For patient with aggressive soft tissue infection in whom urgent antibiotic therapy is required.</li> <li>For patients presenting with a severe or invasive episode (this should include blood culture).</li> <li>Or, in consultation with the physician or Chief Medical Officer of Health (CMOH) or Deputy CMOH (for public health purposes).</li> </ul> <p>Specimens for culture of SSTIs need not be routinely obtained from all individuals presenting with minor skin infections.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>MRSA testing is available through the regional laboratory route.</li> <li>Swab the lesion (send pus) and collect the specimen in Plain Transport Media (RTM). The specimen should be stored and transported to the laboratory in accordance with usual protocols.</li> </ul> |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Occurrence</b>                    | <p>Factors that seem to influence outbreaks of MRSA in the community include the 6 C's:</p> <ul style="list-style-type: none"> <li>• <b>Crowding</b> – crowding and poverty are risk factors;</li> <li>• <b>Contaminated</b> items in the environment – poor hand washing, uncovered wounds, sharing clothing or towels, and poor cleaning of surroundings lead to contamination of the environment;</li> <li>• <b>Contact</b> – close body contact can increase the risk of spreading MRSA; outbreaks have occurred in contact sport teams such as wrestling/football;</li> <li>• <b>Compromised</b> skin – cuts and scrapes can become infected if not kept clean;</li> <li>• <b>Cleanliness</b> – lack of access to resources to maintain basic hygiene (such as water, soap, towels);</li> <li>• <b>Carelessness</b> over the use of antibiotics.</li> </ul> |
| <b>Reservoir</b>                     | <i>S. aureus</i> are bacteria that commonly colonize the skin and nares of healthy people.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Transmission</b>                  | MRSA, like <i>S. aureus</i> in general, is transmitted through direct contact between an infected person and an uninfected person or by indirect contact through touching contaminated objects or surfaces that are part of the infected person's environment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Incubation Period</b>             | Variable and undefined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Communicability</b>               | As long as purulent lesions continue to drain or the carrier state persists. Autoinfection may continue for the period of nasal colonization or duration of active lesions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Susceptibility and Resistance</b> | Susceptibility is greatest among the newborn and the chronically ill. Anyone can get MRSA. However, recent outbreaks have been seen among athletes, prisoners, and other groups of people who live in crowded settings and/or routinely share contaminated items. Lack of access to the resources to maintain hygiene, such as lack of hand washing, may facilitate spread of the bacteria. Outbreaks have also been seen among military recruits, daycare attendees and injection-drug users.                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Case</b>                          | Educate the case as per the section below on health education.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Contacts</b>                      | No contact tracing is required. However, if household members of the case present with skin lesions, consider testing for MRSA and treating if applicable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Outbreaks</b>                     | If a higher than normal amount of disease activity is detected, contact your RCDC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Health Education</b> | <p><b>Use antibiotics wisely:</b></p> <ul style="list-style-type: none"> <li>• Particular attention should be paid to judicious use of antibiotics in outpatient settings to avoid an expanding spectrum of antibiotic resistance among strains of MRSA and other organisms.</li> <li>• Treatment of viral infections with antimicrobials should be avoided.</li> <li>• Patient education regarding antibiotics should include: <ul style="list-style-type: none"> <li>○ Taking the antibiotic on time;</li> <li>○ Taking the antibiotics until finished; do not stop when feeling well;</li> <li>○ Not sharing antibiotics with others.</li> </ul> </li> </ul> <p><b>Preventing the Spread of MRSA at Home (information for the case)</b></p> <ul style="list-style-type: none"> <li>• Keep wounds and lesions covered with clean, dry bandages. This is especially important if the wound is draining.</li> <li>• Hand-wash often with plain soap and warm water, especially if you change your bandages or touch the infected area or anything that might have come in contact with the infected area.</li> <li>• Do not share personal items (e.g. towels, washcloths, razors, clothing and sports equipment) or other items that may have been contaminated by wound drainage.</li> <li>• Wash soiled linens and clothes with hot water and laundry detergent. Drying clothes in a hot dryer, rather than air-drying, may also help kill bacteria in clothes.</li> <li>• Wash utensils and dishes in the usual manner with soap and hot water or using a standard home dishwasher.</li> <li>• Avoid contact sports or other skin-to-skin contact until the infection has healed.</li> <li>• Inform health care providers of MRSA status (either positive or living with someone who is positive) whenever you are in contact with the health care facility so that appropriate disinfection measures can take place in the Health Centre/Hospital/Clinic.</li> <li>• Put used dressings in a plastic bag, tie the plastic bag and place it in garbage. Wash hands after handling dressings.</li> </ul> <p><b>Preventing the Spread of MRSA at Daycares and Schools</b></p> <p>The emphasis must be placed on the consistent application of hygienic measures to reduce the risk of transmission.</p> <ul style="list-style-type: none"> <li>• Isolation of children with MRSA in childcare settings or schools is not a practical solution and impacts negatively on the child's well-being.</li> <li>• In situations in which open lesions cannot be kept covered, consider temporary exclusion from the daycare or school setting until drainage can be contained.</li> <li>• Educate childcare providers, teachers, children and families on general hygiene practices (e.g. hand hygiene, washing hands before eating, after outdoor play, using the bathroom, respiratory etiquette and staying home if ill).</li> <li>• Ensure availability of products to allow hand hygiene to be performed. This includes access to liquid soap in pump dispensers, running water and paper towels to dry hands.</li> <li>• Structure activities to include opportunities for hand hygiene to be practiced.</li> <li>• Ensure that frequently touched surfaces (counter, desks and toys) are cleaned at least daily with a disinfectant solution (cavi-wipes, virex II 256, or the Disinfection Solution Fact Sheet).</li> <li>• Items soiled with body fluids should be cleaned and disinfected as soon as possible and before use by another child.</li> </ul> |

|                                                           | <p><b>Preventing the Spread of MRSA in Sports Settings</b></p> <p>MRSA transmission has been documented in several reports among athletes and contact sports participants. The following recommendations are made for this high-risk group:</p> <ul style="list-style-type: none"> <li>• Practice good hand hygiene. Use alcohol-based hand antiseptic rinse or gel when hand washing facilities are not available.</li> <li>• Individuals participating in sports should shower with soap and water after every practice or tournament.</li> <li>• Do not share hygiene items, such as bar soap or towels.</li> <li>• Ensure regular cleaning of communal bathing facilities and frequently touched surfaces.</li> <li>• Personal items (e.g. towels), should be laundered or cleaned after each use.</li> <li>• Clean or launder shared athletic equipment such as pads or helmets, at least once a week, but ideally after each use.</li> <li>• Assess skin regularly for any lesions. Refer wounds to appropriate healthcare personnel and assure little to no contact to other players.</li> <li>• Coaches and trainers should always use gloves when attending to an athlete's wounds. After performing care, hands should be either washed with soap and water or alcohol-based hand sanitizers.</li> <li>• Coaches should learn to recognize wounds that could potentially be infectious (profound redness, tenderness, pus collection). If an infection is suspected, refer the person (or parents/guardians) to the health care providers in your community.</li> <li>• Coaches should report any clusters of skin infections to the local community health centre and public health centre.</li> </ul> <p><b>Preventing the Spread of MRSA in Food Establishments</b></p> <ul style="list-style-type: none"> <li>• The enterotoxin from <i>S. aureus</i> can be transmitted through food and cause acute food poisoning.</li> <li>• Food handlers with boils, abscesses and other purulent lesions of hands and face should be temporarily excluded from work until lesions are healed.</li> <li>• Educate food handlers about strict food hygiene, sanitation and cleanliness of kitchens, proper temperature control, handwashing, cleaning of fingernails, and the danger of working with exposed skin, nose or eye infections, and uncovered wounds.</li> </ul> |
| <b>Health Settings Management</b>                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Infection Control Measures in Health Care Settings</b> | <p>Direct and indirect contact precautions.</p> <p>All health centers should have <b>cavi-wipes</b> and <b>virex II 256</b> as their cleaners; both are effective against MRSA if manufacturer's instructions are followed. Both of these cleaners are used regularly at the hospital and supplied by the regular medical supply ordering route in your region.</p> <p><b>Important Points to Remember:</b></p> <p><b>Routine Practices</b> – These are practices to be observed at all times for all interactions with patients regardless of the diagnosis.</p> <ol style="list-style-type: none"> <li>1. Handwashing is key. Wash hands before and after every patient contact, after contact with a contaminated item and contact with open wounds (after glove removal). Wearing gloves does not replace handwashing.</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Approval

Approved by Dr. Maureen Baikie, Chief Medical Officer of Health on July 17, 2013.

### 8.2.2 Proportion of Community Isolates of *Staphylococcus aureus* that are Methicillin-Resistant *Staphylococcus aureus* (MRSA), by region, 2012.

Based on laboratory reports received in 2012.

As antibiotic susceptibility patterns can change over time, the table will be updated regularly.

| Region    | Total number of <i>S. aureus</i> isolates | Percentage of isolates that are MRSA |
|-----------|-------------------------------------------|--------------------------------------|
| Baffin    | 389                                       | 11.6%                                |

### 8.2.3 Recommendations for the Treatment of Methicillin-Resistant *Staphylococcus aureus* (MRSA) Skin and Soft Tissue Infections (SSTI)

**Note:** This table is not intended to replace existing clinical management guidelines. For serious cases, nurses should consult with community physicians prior to treatment. For clinical manifestations of MRSA infection not presented here, refer to existing facility-specific clinical practice guidelines:

- 1) The *Canadian Guidelines for the Prevention and Management of CA-MRSA 2006* (see References section). Available online at: <http://www.fields.utoronto.ca/programs/scientific/10-11/drugresistance/emergence/katz3.pdf>
- 2) The *Clinical Practice Guidelines by the Infectious Diseases Society of America for the Treatment of MRSA Infections in Adults and Children 2011* (see Reference section). Available online at: <http://www.gov.mb.ca/health/publichealth/cdc/protocol/meth.pdf>
- 3) Local susceptibility data (sections 8.2.2 and 8.2.4) should guide treatment until antibiotic susceptibility results are available.

| Manifestation                                                                                                                                                                                                                      | Treatment                    | Adult Dose <sup>†</sup>                                                                         | Paediatric Dose <sup>†</sup>                                       | Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

‡ Doses assume normal renal function.

\* Does not provide coverage for B-haemolytic strep. Add a beta-lactam (e.g. cephalexin) if coverage for both CA-MRSA and B-haemolytic strep desired.

## 8.2.4 Nunavut Methicillin-Resistant *Staphylococcus aureus* (MRSA) Antibigram, by region, September 2012–February 2013

An antibiogram, similar to the one below, summarizes the *in vitro* susceptibility patterns of bacteria to various antibiotics in a specific location and timeframe. The following table shows the percentage of MRSA isolates in Nunavut that are susceptible to the following antibiotics. These results are based on laboratory reports received between September 2012 and February 2013. As antibiotic susceptibility patterns can change over time, the antibiogram will be updated regularly.

In treating a skin and soft tissue infection for MRSA, the empiric use of an antibiotic would only be recommended if the susceptibility is known to be >80%. Based on the available data, clindamycin would not be recommended for the Kitikmeot region.

| Antibiotic                                                            | Susceptibility (number of isolates) |             |             |              | Canada*<br>(excludes<br>NU, NWT<br>& YK) |

| Transmission                  | Humans are not the natural reservoir for the virus that causes. Humans are infected when they come into contact with infected hosts. However, with some viruses, infected humans can transmit the virus to another human. |                                                                                                                                                                                                                                                                                                                                                                                                          |
|                               | Crimean Congo VHF                                                                                                                                                                                                         | Transmission to humans occurs through contact with infected animal blood or ticks. Crimean Congo VHF can be transmitted from one infected human to another by contact with infectious blood or body fluids. Documented spread of Crimean Congo VHF has also occurred in hospitals due to improper sterilization of medical equipment, reuse of injection needles, and contamination of medical supplies. |

| <b>Infectious Agent</b>              | Clostridium difficile is a gram-positive, spore forming, anaerobic bacillus. It is widely distributed in the environment and colonizes up to 3-5% of adults without causing symptoms. Some strains can produce two toxins that are responsible for diarrhea: toxin A and toxin B.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Clinical Presentation</b>         | <p>C. difficile is a bacterium that causes mild to severe diarrhea and intestinal conditions such as pseudomembranous colitis (inflammation of the colon). Mild to moderate illness is characterized by watery diarrhea, low-grade fever and mild abdominal pain.</p> <p>Most cases of <i>C. difficile</i> occur in patients who are taking certain antibiotics in high doses or over a prolonged period of time. Some antibiotics can destroy a person's normal bacteria found in the gut, causing <i>C. difficile</i> bacteria to grow. When this occurs, the <i>C. difficile</i> bacteria produce toxins, which can damage the bowel and cause diarrhea. However, some people can have <i>C. difficile</i> bacteria present in their bowel and not show symptoms.</p> <p>There are many different strains of <i>C. difficile</i> and one strain, North American Pulsed Field type 1, known as NAP1, is likely to cause serious illness.</p> |
| <b>Diagnostics</b>                   | Consult your regional laboratory to facilitate prompt identification of <i>C. difficile</i> infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Treatment</b>                     | For people with mild symptoms, no treatment may be required. For more severe cases, medication and sometimes surgery may be necessary. There are also new treatments, such as fecal transplantation, currently being studied for treating persistent <i>C. difficile</i> infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Occurrence</b>                    | <p><i>C. difficile</i> is the most frequent cause of infectious diarrhea in hospitals and long term care facilities in Canada, as well as in other industrialized countries.</p> <p>Community-associated <i>C. difficile</i> disease is less common but is occurring with increasing frequency.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Reservoir</b>                     | <i>C. difficile</i> can be isolated from the soil and is found commonly in the hospital environment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Transmission</b>                  | <i>C. difficile</i> is acquired from the environment or from stool of other colonized or infected people by the fecal-oral route                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Incubation Period</b>             | The incubation period is unknown; colitis usually develops 5 to 10 days after initiating of antimicrobial therapy but can occur on the first day and up to 10 weeks after therapy cessation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Communicability</b>               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Susceptibility and Resistance</b> | <p>People in healthcare settings are most at risk because <i>C. difficile</i> is often a healthcare-associated infection. These infections can be transmitted within a hospital when infection prevention and control measures are not followed.</p> <p>Those at higher risk include the elderly, people with severe underlying illness, and people taking certain antibiotics (especially over a prolonged period of time) or</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Approved by Dr. Maureen Baikie, Chief Medical Officer of Health, September 18, 2015                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## **9.0 Infections Spread By Respiratory Routes**

### **Purpose**

The purpose of this section of the Communicable Disease Manual is to provide guidelines for the investigation and management of individuals who have been diagnosed with notifiable infections spread by respiratory routes, including Influenza, Invasive Group A Streptococcal Disease, Invasive Meningococcal Disease, Invasive Pneumococcal Disease, Legionellosis, Leprosy, Respiratory Syncytial Virus (RSV) and Severe Acute Respiratory Syndrome (SARS).

### **Legislation/Policy**

Authority for the reporting of notifiable infections spread by respiratory routes and the public health management comes from the *Public Health Act, Communicable Disease Regulations*.

All clients who have been diagnosed with a notifiable infection spread by respiratory routes must be reported to the Chief Medical Officer of Health (CMOH).

All clients who are suspected to have or have a confirmed notifiable infection spread by respiratory routes are to be followed as per the protocols in this section.

## Roles and Responsibilities

**Table 9.1: Roles and responsibilities for follow-up of notifiable infections spread by respiratory routes**

| <b>Role</b>                                                                                   | <b>Responsibilities</b>                                                                                                                                                                                                                                                                                                                                                                                                                        |

|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Infectious Agent</b>      | Influenza viruses are classified into three distinct types on the basis of major antigenic differences: Influenza A, B and C. Influenza A is further categorized into subtypes based on the presence of two surface antigens: hemagglutinin (H) and neuraminidase (N).                                                                                                                                                                                                                                                                                                                    |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Clinical Presentation</b> | Influenza is an acute respiratory illness. Influenza-like illness (ILI) is defined as an acute onset of respiratory illness with fever <b>and</b> cough <b>and one or more of</b> : sore throat, arthralgia, myalgia, or prostration. Fever may not be prominent in the elderly and children less than five years old. Nausea, vomiting and diarrhea are uncommon; however, such symptoms may accompany the respiratory phase of the disease in children. In some cases it will be difficult to distinguish Influenza from other respiratory illnesses.                                   |
| <b>Diagnostics</b>           | <p>The preferred specimen for seasonal influenza virus is the nasopharyngeal (NP) swab taken within the first three days of illness onset.</p> <p>Typically, when Influenza is first suspected in the community, take an NP swab for up to 5 patients that meet the ILI definition in a variety of age groups over a few days.</p> <p>*Note: due to the COVID-19 pandemic, a respiratory panel should be completed on <u>all individuals</u> presenting with ILI symptoms. See the COVID-19 Public Health Protocol for further guidance.</p> <p>See Appendix A for NP swab procedure.</p> |
| <b>Treatment</b>             | Care is typically supportive. Antiviral medications such as Oseltamivir (Tamiflu) may be used for the treatment of Influenza at the discretion of the prescribing practitioner. Refer to the Government of Nunavut Drug Formulary for more information.                                                                                                                                                                                                                                                                                                                                   |

| Pathogen                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Occurrence</b>                    | <p><b>Worldwide:</b> The annual global mortality rate is estimated to be approximately 1 million, with majority of deaths in those over 65 years, however this depends on circulating strain.</p> <p><b>Canada:</b> It is estimated that in a given year there are up to 20,000 Influenza-related hospitalizations and between 4,000–8,000 Influenza-related deaths, predominantly in seniors.</p> <p><b>Nunavut:</b> There have been hospitalizations and deaths related to Influenza; rates are not available for inclusion here at this time.</p> |
| <b>Reservoir</b>                     | Primarily human; birds and mammals are likely sources of new human subtypes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Transmission</b>                  | <p>Person-to-person by droplet spread. As droplets are released or shed from an infected person when they sneeze, cough or talk they can be propelled (generally up to 2 meters) through the air and deposited on the mouth or nose of people within this range.</p> <p>Though much less frequent, droplets may also be deposited on objects and spread infection to those touching the surfaces and bringing the virus to their mucous membranes.</p>                                                                                               |
| <b>Incubation Period</b>             | Usually 1-3 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Communicability</b>               | Adults may become infectious during the 24 hours prior to onset of symptoms until approximately 5–7 days after illness onset. Viral shedding in those infected usually peaks during the first three days of illness and ceases within 7 days but can be prolonged in children (greater than 10 days) and the immunocompromised.                                                                                                                                                                                                                      |
| <b>Susceptibility and Resistance</b> | The impact of epidemics and pandemics depends on the population immunity level, strain virulence, extent of viral antigenic variation and number of previous infections. Age-specific attack rates reflect persisting immunity from past infections and experience with similar strains; for this reason the infection incidence is often highest in school-aged children.                                                                                                                                                                           |

| Public Health Management                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Case</b>                                               | <p>Individual cases of Influenza do not require public health follow-up. No case report form is required. Please note the reporting requirements for individuals being tested for COVID-19 (e.g. respiratory infections) however.</p> <p>Advise individuals to stay away from common settings like work while ill to limit exposure to others, especially those at high risk for complications, until they are feeling well.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Contacts</b>                                           | Contact management of Influenza cases is not recommended.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Outbreaks</b>                                          | Call Regional Communicable Disease Coordinator (RCDC) if an increase in Influenza or ILI activity is noted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Prevention Messaging</b>                               | <p>The best prevention measure is an annual influenza immunization. All Nunavut residents aged 6 months and older are eligible for publicly funded influenza vaccine yearly. Refer to the Influenza Immunization Program in section 11.1 of the Nunavut Immunization Manual for details.</p> <p>Basic personal hygiene is important in reducing transmission, e.g. covering nose and mouth when coughing or sneezing, coughing into the elbow or sleeve, regular hand hygiene.</p> <p>Prevention recommendations in residential group settings (Appendix B) and community settings (Appendix C and D) are also provided.</p> <p><b>Note: If pneumococcal polysaccharide vaccine has not already been given, take the opportunity to vaccinate adults 50 and older as well as other high-risk individuals against pneumococcal disease when influenza vaccine is given. For more information about pneumococcal polysaccharide vaccines, refer to section 9.0 Active Immunization Protocols in the Immunization manual.</b></p>                                                     |
| Health Settings Management                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Infection Control Measures in Health Care Settings</b> | <p>Use routine practices and droplet/contact precautions.</p> <p>When triaging, suspect Influenza cases should be placed in a separate room away from other patients as soon as possible or separated by at least two meters from other people waiting if it is not possible to use another room</p> <p>Individuals suspected to have Influenza should be instructed to put on a surgical/procedural mask (with ear loops) while they are in the clinic, if tolerated.</p> <p>Thorough hand hygiene using either liquid soap and water or 60-90% alcohol-based sanitizer, before and after patient contact/assessment and after contact with contaminated equipment.</p> <p>When handling linen and garbage, if it is soiled or at risk of being soiled, create a barrier by wearing gloves and gowns that cover exposed contact skin areas.</p> <p>Usual procedures for cleaning and disinfecting rooms and patient care equipment are sufficient for Influenza. Increased frequency of cleaning may be required if there is increased incidence or in an outbreak situation.</p> |

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Reporting Requirements and Forms</b> | <p>Influenza, regardless of type (e.g. Influenza A, Influenza B, pH1N1), is a reportable infection. A case report form is <b>not required</b> for influenza cases, however it is likely that a Person Under Investigation form for individuals being tested for COVID-19 would need to be submitted</p> <p>Report respiratory illness outbreaks, or any incident of viral respiratory illness causing death to RCDC immediately who will report these to the office of the Chief Public Health Officer (CPHO) (formerly the Chief Medical Officer of Health).</p> <p>Viral Respiratory Illness Surveillance is conducted in the communities (e.g. Community Health Centres, Public Health Units, and Qikiqtani General Hospital) each week during the influenza season. This provides information that can detect early outbreaks of influenza, and can be used to guide prevention and control activities.</p> <ol style="list-style-type: none"> <li>1. A reminder will be sent from the RCDC <b>each Monday</b> during the influenza season (time period will vary every year and be specified by the PHO) that contains questions related to suspect viral respiratory illness activity in the community for the past week (Sunday to Saturday).</li> <li>2. All questions should be answered and sent back to the RCDC <b>every Tuesday of the influenza season.</b></li> </ol> <p>RCDCs will collate the information for their region and forward to the office of the CPHO <b>every Thursday by noon.</b></p> |

## Approval

Approved by Dr. Jasmine Pawa, Deputy Chief Public Health Officer (Locum) on September 30, 2020.

### Nasopharyngeal Swab Procedure

1. Use the swab supplied with the viral transport media.
2. Explain the procedure to the patient.
3. When you collect specimens, wear gloves and a mask. Change gloves and wash your hands between each patient.
4. If the patient has a lot of mucous in the nose, this can interfere with the collection of cells. Either ask the patient to use a tissue to gently clean out visible nasal mucous or clean the nostril yourself with a cotton swab (**not** the same swab you will be using to collect the specimen).
5. Estimate the distance to the nasopharynx; prior to insertion, measure the distance from the corner of the nose to the front of the ear; the swab should be inserted approximately half the length of this distance.
6. Seat the patient comfortably. Tilt the patient's head back slightly to straighten the passage from the front of the nose to the nasopharynx. This will make insertion of the swab easier.
7. Insert the swab along the medial part of the septum, along the floor of the nose, until it reaches the posterior nares; gentle rotation of the swab may be helpful (if resistance is encountered, try the other nostril, as the patient may have a deviated septum).
8. Cut the shaft of the swab with scissors, recap and place in a specimen bag with the requisition to be sent to the laboratory.

## **Appendix C**

### **Influenza in Group Residential Settings**

The following recommendations are made for the management of influenza in group residential settings (e.g. long-term care facilities, children's residential group homes, shelters, etc.):

#### **Prior to Onset of Influenza Activity:**

- Educate residents and staff on personal preventive measures
  - Encourage annual influenza immunization for all residents and staff
  - Reinforce hand hygiene, cough etiquette (e.g. cough into elbow/sleeve), environmental cleaning practices
  - Have a contingency plan to deal with staff illness

#### **During Periods of Influenza Activity:**

- Ask the facility to report increased ILI activity, laboratory-confirmed cases or suspected influenza/ILI outbreaks to the Community Health Nurse. Please advise the RCDC of these reports.
- Refer to the *Seasonal Influenza Antiviral Treatment Protocol Algorithm* in the GN Drug Formulary.
- Recommend that staff who are ill stay home and not work at the facility while symptomatic
- Recommend that those who are ill do not visit the facility
- Consider posting signage at entrances indicating that there is influenza activity in the facility (see attached)
- Increase the frequency of environmental cleaning

#### **Antiviral Prophylaxis in the Group Residential Setting:**

- Antiviral prophylaxis for influenza is often recommended in facilities with large numbers of residents at high-risk of acquiring influenza due to their housing arrangements and health status. However, the following realities exist in Nunavut:
  - Facilities generally have a small number of residents
  - Laboratory confirmation of influenza infection can take several days to weeks from the time of specimen collection to laboratory reporting
  - Only a small number of facilities have on-site nursing staff that could arrange/administer antiviral prophylaxis
  - The residents of the facilities are not always those considered to be at high risk of acquiring influenza and developing complications (i.e. all age groups exist within facilities)
- Given the above factors, antiviral prophylaxis for influenza in the group residential setting **is not** recommended in Nunavut

**Please Note:** The CMOH/DCMOH is available for consultation regarding influenza in group residential settings as required. Contact the RCDC to arrange this as necessary.

# Caution

Residents/Staff of this facility are experiencing influenza like illness. Please do the following:

- If you or any member of your family is having respiratory symptoms, please return to visit when you or your relatives are well.
- If you are well, limit your visit to your relative or loved one. Do not visit other residents.
- Do not bring children to this facility until the respiratory illnesses clear.
- When you come in, wash your hands or use hand sanitizer.
- When you are leaving, wash your hands or use hand sanitizer.

Thank you. You are helping to protect the residents/staff of this facility.

# Public Service Announcement

## Flu season and vaccination in Nunavut

**Start Date:** October 13, 2020

**End Date:** December 31, 2020

## Nunavut-wide

**90 sec**

Flu season is here and the best way to protect yourself, your family and your community is to get vaccinated.

All Nunavummiut over six months of age are encouraged to get the flu vaccine. It is free and available at all community health centres in Nunavut, and at Iqaluit Public Health, building 1091.

Since COVID-19 has very similar symptoms as a cold or the flu, it is important that those who are able get their flu shots do so. While the flu shot does not protect against other viruses or bacteria, it can help reduce pressure on our health system, especially if COVID-19 is confirmed in a community.

Vaccines should arrive in all communities by mid-October. The vaccine can be given at any time in the season. Please be aware that the sooner you do receive it, the better you will be able to reduce your risk.

Due to COVID-19 precautions, you may have to book an appointment for your flu shot ahead of time. Please contact your health centre for more information.

Following these steps can help stop the spread of influenza, COVID-19, and other respiratory illnesses:

- Stay home when you feel sick.
- Cough or sneeze into your sleeve.
- Wash your hands often.
- Avoid touching your face.
- Throw used tissues in the trash right away.
- Keeping distance from others when out and about.
- Don't smoke indoors or around others, especially babies.

| <b>Infectious Agent</b>      | Invasive Group A Streptococcal (iGAS) Disease is caused by the gram-positive B-hemolytic bacterium, <i>Streptococcus pyogenes</i> ( <i>S. pyogenes</i> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Clinical Presentation</b> | <p>Symptoms preceding the onset of iGAS disease are variable and may include unusually severe pain, swelling, fever, chills, flu-like symptoms, myalgias, generalized macular rash, nausea, vomiting, diarrhea, malaise and joint pain.</p> <p>Clinical evidence of disease may manifest as several conditions including:</p> <ul style="list-style-type: none"> <li>• Streptococcal Toxic Shock Syndrome (STSS)</li> <li>• Necrotizing Fasciitis (NF)</li> <li>• Necrotizing Myositis (NM)</li> <li>• Meningitis</li> </ul> <p>STSS is the most serious manifestation of iGAS disease. It comprises a primary site of Group A Streptococcus (GAS) infection together with hypotension, adult respiratory distress syndrome (ARDS), renal impairment, rapid onset of shock and multi-organ failure. STSS has a mortality rate of up to 81%. Survivors can be left with severe long-term disability.</p> <p>Symptoms of NF and NM include fever, and a red painful swelling of tissue, which spreads rapidly. Death may occur in 12 to 24 hours. NF and NM are less severe than STSS; however they have a mortality rate of approximately 20%.</p> <p>The most common primary site of iGAS infections is soft tissue, but pneumonia, septic arthritis and primary bacteremia may also occur. Pneumonia with isolation of GAS from a sterile site, or from a bronchoalveolar lavage (BAL) non-sterile site when no other cause has been identified, should be regarded as a form of invasive disease for the purposes of public health management.</p> <p>Bacterial pharyngitis and cutaneous infections (e.g. impetigo, cellulitis) are non-invasive and less severe manifestations of GAS but are considerably more common.</p> <p><i>S. pyogenes</i> may colonize the throat and skin of individuals (carriers) without symptoms and may be passed from person to person.</p> |
| <b>Diagnostics</b>           | <p>Laboratory criteria for diagnosis require the isolation of Group A Streptococcus (<i>S. pyogenes</i>) by culture from a normally sterile site (e.g. blood or cerebrospinal fluid or, less commonly, joint, pleural or pericardial fluid).</p> <p>Follow your regional laboratory procedures for serologic testing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Treatment</b>             | A discussion of the treatment of iGAS is beyond the scope of these guidelines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Incubation Period</b>             | Short, usually 1 to 3 days, rarely longer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Communicability</b>               | Transmissibility generally ends within 24 hours of treatment. If untreated, uncomplicated cases are communicable for 10–21 days or until infection is resolved. Asymptomatic carriage is quite common (up to 15% of the population). In cases with purulent discharges, communicability extends for weeks or months.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Susceptibility and Resistance</b> | <p>Susceptibility is general. Incidence appears to be highest among young children (especially those with concomitant varicella), the elderly, and those with underlying medical conditions; however, the disease can occur in otherwise healthy children, adolescents, and adults. No gender or racial differences in susceptibility have been identified. A history of minor injury, blunt or penetrating trauma, surgery, and breaks in the skin or mucous membranes (e.g. sores, scratches, eczema, blisters, chickenpox, etc.) may be noted in cases of iGAS disease. It has been estimated that chickenpox increases the risk of severe iGAS infection among previously healthy children by 40-60 fold.</p> <p>The risk of iGAS infection among people living in the same household as a case is much higher than the rate of sporadic disease in the general population. The estimated attack rate among household contacts is estimated to be 3 per 1,000.</p> <p>Immunity only develops against the specific 'M' type of GAS and may last for years.</p> <p>The risk of iGAS is significantly associated with the following underlying conditions: age &gt;65 years; injection drug use (IDU); heart disease; high dose steroid use (immunosuppressive doses); Diabetes Mellitus; cancer; varicella infection; alcohol abuse; chronic lung disease; skin trauma and HIV infection.</p> |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Case</b>                          | <p>Contact and interview the case. In situations where the case is too ill to be interviewed, information should be obtained from family, health care providers, etc.</p> <p>Complete the <a href="#">Bacterial Diseases Surveillance Form – Streptococcus pyogenes (Group A)</a> dated February 2011 or later (section 9.2.2).</p> <p><b>Educate the case about the following:</b></p> <ul style="list-style-type: none"> <li>• Close contacts may be at increased risk for iGAS disease. Work with the case to identify and follow all close contacts (refer to Contact Management section);</li> <li>• Keeping all open cuts and sores bandaged until healed;</li> <li>• Not sharing drug snorting or smoking equipment such as straws or pipes, or injection equipment such as cookers, cotton, filters, water, syringes and needles.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Contacts                                                             | <p>Because of the severity of iGAS disease and the increased risk of infection among close contacts (see below) of sporadic cases, aggressive contract tracing is essential to identify close contacts at increased risk of disease and administer chemoprophylaxis. <b>Please contact your Regional Communicable Disease Coordinator (RCDC) during regular business hours, or Medical Officer of Health (MOH) on call if after regular business hours for consultation on chemoprophylaxis.</b></p> <p><b>Definition of close contacts:</b></p> <ul style="list-style-type: none"><li>Household contacts of a case spending at least 4 hours per day on average in the 7 days prior to onset (or 20 hours in the week prior to onset) with the case</li><li>Non-household contacts who shared the same bed with the case or had sexual contact with the case in the 7 days prior to onset</li><li>Persons who have had direct mucous membrane contact with the oral or nasal secretions of a case (e.g. mouth-to-mouth resuscitation, open mouth kissing) or unprotected direct contact with an open skin lesion of the case</li><li>Injection drug users who have shared needles or equipment with the case</li></ul> <p>School classmates (kindergarten and older), work colleagues, as well as social or sports contacts of a case are usually not considered close contacts unless they fit into one of the above categories.</p> <p><b>Important Notes:</b></p> <ol style="list-style-type: none"><li>Chemoprophylaxis should only be offered:<ol style="list-style-type: none"><li>To close contacts (see above) of a confirmed <i>severe case</i>. Severe cases are defined as those having the presence of STSS, soft-tissue necrosis (including NF, MF or gangrene), meningitis, GAS pneumonia, other life-threatening conditions or a confirmed case resulting in death; <b>AND</b></li><li>If close contacts have been exposed to the case during the period from 7 days prior to onset of symptoms in the case to 24 hours after the case’s initiation of antimicrobial therapy.</li></ol></li><li>Chemoprophylaxis of close contacts should be administered as soon as possible and preferably within 24 hours of case identification but is still recommended for up to 7 days after the last contact with a severe case.</li><li>Close contacts of all confirmed cases (i.e. regardless of whether the case is a severe one) should be alerted to signs and symptoms of invasive GAS and be advised to seek medical attention immediately should they develop febrile illness or any other clinical manifestations of GAS infection within 30 days of diagnosis in the index case.</li></ol> <p>All contact tracing investigations must be reported to the RCDCs by filling out and submitting the <a href="#">Group A Streptococcal Disease, Invasive (iGAS) Contact Investigation Form</a> (section 9.2.3).</p> <p><b>Recommended Chemoprophylaxis Regimens for Close Contacts*</b></p> <table><tr><th>Drug</th><th>Dosage</th><th>Comments</th></tr><tr><td>First-generation cephalosporins; cephalexin, cephadroxil, cephradine</td><td><b>First line</b><br/>Children and adults: 25 to 50 mg/kg daily, to a maximum of 1g/day in 2 to 4 divided doses x 10 days</td><td>Recommended drug for pregnant and lactating women.<br/>Should be used with caution in patients with allergy to penicillin.<br/>Use of cephalosporins with</td></tr></table> | Drug                                                                                                                                                    | Dosage | Comments | First-generation cephalosporins; cephalexin, cephadroxil, cephradine | <b>First line</b><br>Children and adults: 25 to 50 mg/kg daily, to a maximum of 1g/day in 2 to 4 divided doses x 10 days | Recommended drug for pregnant and lactating women.<br>Should be used with caution in patients with allergy to penicillin.<br>Use of cephalosporins with |

## 1.0 Introduction

Before the introduction of antimicrobials, morbidity from *Streptococcus pyogenes* or group A streptococcal (GAS) infection was common. The introduction of penicillin and other antibiotics resulted in a steady decline in the incidence of GAS disease through the 1970s. However, in the 1980s, there was a worldwide resurgence of GAS infection, as well as an apparent increase in virulence<sup>(1-6)</sup>.

Because of the severity of invasive GAS disease and the increased risk of infection among close contacts of sporadic cases, these guidelines have been formulated through a consensus process to advise public health officials and clinicians about the public health management of invasive GAS cases and their close contacts. Participants involved in the consensus process are listed in Annex 1.

## 2.0 Objectives

These guidelines have been prepared to assist in the public health investigation and management of invasive GAS disease in Canada. They address the following:

- surveillance and reporting
- public health response to cases
- chemoprophylaxis of close contacts
- investigation and control of invasive GAS disease in long-term care facilities (LTCF) and child care centres
- laboratory issues for *S. pyogenes* (Annex 2)
- infection control issues for invasive GAS infection (Annex 3).

## 3.0 Surveillance of Invasive GAS Disease in Canada

Invasive GAS infection is reportable in every province and territory (P/T) in Canada. Most jurisdictions rely on passive surveillance for identification of cases. Each P/T has procedures in place for the rapid notification of cases to medical officers of health and timely reporting to the appropriate P/T public health official. Readers should refer to the case definitions specified by their respective P/T jurisdictions for the purposes of local reporting.

*S. pyogenes* is a Gram-positive coccus, which occurs as pairs or as chains of short to moderate size<sup>(7)</sup>. Invasive GAS disease is confirmed through laboratory testing of specimens taken from normally sterile sites. Local microbiology laboratories perform antibiotic susceptibility testing for clinical purposes, whereas the National Centre for Streptococcus (NCS) conducts susceptibility testing for surveillance purposes only. Some provincial public health laboratories and academic reference laboratories may perform specific molecular analyses in support of outbreak investigations; however, the NCS is the only laboratory in Canada that performs M protein typing and *emm* gene sequencing of *S. pyogenes* isolates for routine surveillance. Serotyping, molecular sequencing and antimicrobial susceptibility testing are helpful in characterizing outbreaks, determining disease trends and guiding appropriate clinical management of cases and contacts. Annex 2 provides further details on laboratory support for outbreak investigation of invasive GAS disease.

Only confirmed cases of invasive GAS disease are notifiable at the national level. Currently, some P/Ts report case-by-case data with basic core variables on a monthly basis to the Notifiable Diseases Reporting System, and others report aggregate data by age, sex and month of episode.

## 4.0 Epidemiology of Invasive GAS Disease in Canada

Invasive GAS disease became nationally notifiable in January 2000. The most recent year for which complete national data have been published is 2001. The overall incidence of disease in 2001 was 2.7 per 100,000 population. The highest reported incidence rates occurred among adults  $\geq 60$  years of age (5.3 per 100,000), followed by children  $< 1$  year of age (4.8 per 100,000) and children 1 to 4 years of age (3.6 per 100,000)<sup>(8)</sup>. Preliminary data for subsequent years show slight variation in overall incidence: 2.8 per 100,000 in 2002, 3.2 per 100,000 in 2003 and 2.6 per 100,000 in 2004 (unpublished data, Public Health Agency of Canada).

Elevated rates of invasive GAS disease have been detected among Aboriginals living in the Canadian Arctic through the population-based International Circumpolar Surveillance system. Between 2000 and 2002, no cases of invasive GAS disease were reported among non-Aboriginals in the territories, northern Quebec or northern Labrador. In contrast, among Aboriginals in northern Canada, the incidence rate of disease was 9.0 per 100,000 in 2000 (7 cases), 3.0 per 100,000 in 2001 (2 cases) and 5.0 per 100,000 in 2002 (4 cases)<sup>(9-11)</sup>. Preliminary data from 2003 also indicate a higher rate of invasive GAS disease in Aboriginal (2.6 per 100,000) compared with non-Aboriginal (1.9 per 100,000) populations (seven cases overall)<sup>(12)</sup>.

The NCS provides laboratory reference services for GAS associated with invasive disease. Among 2,195 isolates from blood, brain or cerebrospinal fluid (CSF) between 1993 and 1999, the most frequent M protein type identified was M1 (28%), followed by serotypes M28 (9%), M12 (8%), M3 (8%) and M4 (6%)<sup>(13)</sup>. With the exception of 2000-2001, M1 was consistently the most frequently encountered serotype between 1992 and 2004-2005<sup>(13-16)</sup>. The NCS also tests *S. pyogenes* isolates for antibiotic sensitivity. Of 817 isolates from all sites tested in 2004-2005, 11.1% demonstrated resistance to erythromycin, and 2.0% were resistant to clindamycin. No isolates

demonstrated resistance to penicillin, chloramphenicol or vancomycin<sup>(16)</sup>.

Clinical data for cases of invasive GAS infection are not collected nationally. Data from the Ontario GAS Study provide further information on the epidemiology of invasive disease. In cases detected by this enhanced population-based surveillance system during 1992 and 1993, the most common clinical presentations were skin or soft-tissue infections (48%), bacteremia with no septic focus (14%) and pneumonia (11%)<sup>(17)</sup>. Thirteen percent of cases were classified as streptococcal toxic shock syndrome (STSS), and 6% had necrotizing fasciitis (NF). The overall case fatality rate (CFR) was 13%, although syndrome-specific CFRs were highest among patients with STSS (81%), NF (45%) and pneumonia (33%). Overall, 44 (14%) of infections were classified as nosocomial, including 14 cases acquired in LTCF for the elderly. The risk of invasive GAS disease was significantly associated with several underlying conditions, including HIV infection, cancer, heart disease, diabetes, lung disease and alcohol abuse. Among the isolates for which serotyping was available, the most common serotypes were M1 (24%), M12 (7.4%), M4 (6.5%), M28 (6.2%) and M3 (5.8%)<sup>(17)</sup>. More recent findings from Ontario enhanced surveillance system from 1992 through 1999 demonstrate the increasing incidence of specific clinical manifestations of invasive GAS infections. The annual incidence rate of NF increased from 0.08 per 100,000 population in 1992 to 0.49 per 100,000 in 1995 ( $p < 0.001$ )<sup>(18)</sup>. The annual incidence of GAS pneumonia increased from 0.16 per 100,000 in 1992 to 0.35 per 100,000 in 1999<sup>(19)</sup>.

Enhanced GAS surveillance in Alberta between 2000 and 2002 showed higher provincial incidence rates of disease than observed through national passive surveillance, at 5.0 (in the year 2000), 5.7 (2001) and 3.8 (2002) per 100,000, with corresponding CFRs of 10.7%, 13.2% and 6.8%, respectively. Incidence rates were highest in the metropolitan regions of Calgary (6.9 per 100,000) and Edmonton (4.8 per 100,000). Acquisition in a hospital, nursing home or LTCF was the most frequently reported risk factor (17%), followed by injection drug use (13%), pregnancy-

related risk factors (13%), varicella (12%) and cancer (11%). The most common serotypes were M1 (16%), M3 (12%) and PT2967 (10%). There was seasonal variation, the greatest number of cases occurring in the winter and early spring months<sup>(20)</sup>.

## 5.0 Definitions

### 5.1 National case definition

In Canada, confirmed cases of invasive GAS disease are notifiable at the national level. Probable cases of invasive GAS disease are not nationally notifiable (Table 1).

**Table 1: National Case Definition for Invasive GAS Disease<sup>(21)</sup>**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                      |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Confirmed case</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Laboratory confirmation of infection with or without clinical evidence of invasive disease.* Laboratory confirmation requires the isolation of group A streptococcus ( <i>Streptococcus pyogenes</i> ) from a normally sterile site. |
| <b>Probable case</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Invasive disease* in the absence of another identified etiology and with isolation of GAS from a non-sterile site.                                                                                                                   |
| <p>*Clinical evidence of invasive disease may be manifested as several conditions. These include:</p> <p>a) STSS, which is characterized by hypotension (systolic blood pressure <math>\leq 90</math> mmHg in adults or <math>&lt; 5</math>th percentile for age in children) and at least two of the following signs:</p> <ol style="list-style-type: none"> <li>renal impairment (creatinine level <math>\geq 177</math> <math>\mu</math>mol/L for adults)</li> <li>coagulopathy (platelet count <math>\leq 100,000/\text{mm}^3</math> or disseminated intravascular coagulation)</li> <li>liver function abnormality (SGOT [AST], SGPT [ALT] or total bilirubin <math>\geq 2 \times</math> upper limit of normal)</li> <li>adult respiratory distress syndrome (ARDS)</li> <li>generalized erythematous macular rash that may desquamate;</li> </ol> <p>b) soft-tissue necrosis, including necrotizing fasciitis, myositis or gangrene;</p> <p>c) meningitis; or</p> <p>d) a combination of the above.</p> |                                                                                                                                                                                                                                      |

SGOT = serum glutamic oxaloacetic transaminase; AST = aspartate aminotransferase; SGPT = serum glutamate pyruvate transaminase; ALT = alanine aminotransferase

A normally sterile site is defined as blood, CSF, pleural fluid, peritoneal fluid, pericardial fluid, deep tissue specimen taken during surgery (e.g. muscle collected during debridement for necrotizing fasciitis), bone or joint fluid. This does not include middle ear or superficial wound aspirates.

Pneumonia with isolation of GAS from a sterile site, or from a bronchoalveolar lavage (BAL) when no other cause has been identified, should be regarded as a form of invasive disease for the purposes of public health management; however, as BAL does not provide a sterile site specimen, the latter would not meet the national case definition and would not be nationally notifiable.

### 5.2 Definitions for public health management

Tables 2 and 3 provide definitions of cases and close contacts.

**Table 2. Definition of Cases**

|                        |                                                                                                                                                                                                                                                                                  |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Sporadic case</b>   | A single case of invasive GAS disease occurring in a community where there is no evidence of an epidemiologic link (by person, place or time) to another case.                                                                                                                   |
| <b>Index case</b>      | The first case identified in an organization- or community-based outbreak. Identifying the index case in an outbreak is important for the characterization and matching of GAS isolate strains.                                                                                  |
| <b>Subsequent case</b> | A case with onset of illness occurring within 21 days and caused by the same strain as another case (including sporadic or index cases) and with whom an epidemiologic link can be established. Most subsequent cases in the community will occur within 7 days of another case. |
| <b>Severe case</b>     | Case of STSS, soft-tissue necrosis (including NF, myositis or gangrene), meningitis, GAS pneumonia, other life-threatening conditions or a confirmed case resulting in death.                                                                                                    |

An epidemiologic link can be established when a person has one or both of the following in common with a confirmed case:

- contact with a common, specific individual (including confirmed or probable cases);
- presence in the same location (e.g. school, LTCF, child care centre) at or around the same time.

For public health management, cases that occur after the index case with whom an epidemiologic link can be established may have acquired the disease directly from the index case or from another common source.

**Table 3. Definition of Close Contacts**

|                                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ■ Household contacts of a case who have spent at least 4 hours/day on average in the previous 7 days or 20 hours/week with the case                                                                                          |
| ■ Non-household persons who share the same bed with the case or had sexual relations with the case                                                                                                                           |
| ■ Persons who have had direct mucous membrane contact with the oral or nasal secretions of a case (e.g. mouth-to-mouth resuscitation, open mouth kissing) or unprotected direct contact with an open skin lesion of the case |
| ■ Injection drug users who have shared needles with the case                                                                                                                                                                 |
| ■ Selected LTCF contacts (see Section 6.3)                                                                                                                                                                                   |
| ■ Selected child care contacts (see Section 6.4)                                                                                                                                                                             |
| ■ Selected hospital contacts (see Annex 3)                                                                                                                                                                                   |

In order to be considered a close contact, there must have been exposure to the case during the period from 7 days prior to onset of symptoms in the case to 24 hours after the case's initiation of antimicrobial therapy. School classmates (kindergarten and older), work colleagues, as well as social or sports contacts of a case are not usually considered close contacts, unless they fit into one of the categories in Table 3.

An outbreak is defined as increased transmission of GAS causing invasive disease in a population. Outbreaks of invasive GAS disease do not occur in the community frequently and typically involve two cases (i.e. case-pairs) who have had close contact<sup>(17,22,23)</sup>. Criteria defining the impetus for action for organization-based outbreaks or clusters are found in Table 4.

**Table 4. Impetus for Action for Organization-based Outbreaks or Clusters**

|                                |                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Long-term care facility</b> | An incidence rate of culture-confirmed invasive GAS infections of > 1 per 100 residents per month or at least two cases of culture-confirmed invasive GAS infection in 1 month in facilities with fewer than 200 residents or an incidence rate of suggested invasive or non-invasive GAS infections of > 4 per 100 residents per month. |
| <b>Child care centre</b>       | One severe case of invasive GAS disease in a child attending a child care centre.                                                                                                                                                                                                                                                        |
| <b>Hospital</b>                | One or more linked invasive or non-invasive GAS cases in either patients or staff occurring within 1 month of an invasive GAS case (see Annex 3).                                                                                                                                                                                        |

## 6.0 Management of Invasive GAS Disease

The public health response to a sporadic case of invasive GAS disease, as described in Section 5.1, includes management of the case, contact identification and tracing, and maintenance of surveillance for further cases. The management of invasive GAS disease is divided into four subsections: the management of cases, contact management, management of cases occurring at LTCFs and management of cases occurring among children attending child care centres. Information about management in the hospital setting can be found in Annex 3.

### 6.1 Case management

Although this document is not focused on the treatment of GAS disease, where there is a strong clinical suspicion of invasive GAS disease a specimen from a normally sterile site should be obtained for culture, if possible, and empiric therapy started quickly. Confirmatory culture is important to ensure that GAS infection is diagnosed.

Laboratory testing of antimicrobial sensitivity of the GAS strain may be useful for determining appropriate antibiotic therapy. Readers should refer to treatment guidelines that address the clinical management of invasive GAS disease, which is beyond the scope of this document<sup>(24-26)</sup>.

The case or a proxy for the case should be interviewed to determine close contacts.

### 6.2 Contact management

The cornerstone of prevention of secondary cases of invasive GAS is aggressive contact tracing to identify people at increased risk of disease (i.e. close contacts). Close contacts of an invasive GAS case may be at increased risk of secondary disease<sup>(17,22,27)</sup>. It is important that they should be alerted to signs and symptoms of invasive GAS disease and be advised to seek medical attention immediately should they

develop febrile illness or any other clinical manifestations of GAS. Persons who are close contacts of cases are defined in Table 3. The recommendations for contact management in Canada are shown in Table 5. Recommended chemoprophylaxis regimens are discussed in Section 7.0.

The following were considered in determining further management of close contacts: evidence of GAS transmission, reasonable theoretical risk, limited evidence of effectiveness of chemoprophylaxis, risks and benefits of chemoprophylaxis and the number of close contacts who would need to receive chemoprophylaxis to prevent a case. The recommendations for contact management are based on expert opinion and very limited evidence.

- ***The risk of subsequent infection in household contacts is estimated to range between 0.66 and 2.94 per 1,000, and this estimate is based on extremely small numbers of subsequent cases. Most subsequent cases in the Ontario GAS study occurred within 7 days after last contact with an infectious case.***

Two population-based studies have estimated that the rate of invasive GAS infection among people living in the same household as a case is much higher than the rate of sporadic disease in the general population. The Ontario Group A Streptococcal Study estimated that the attack rate among household contacts was 2.94 per 1,000 (95% confidence interval [CI]: 0.80-7.50)<sup>(17,27)</sup>. In comparison, the attack rate among household contacts estimated using data from the US Active Bacterial Core Surveillance (ABCs)/Emerging Infections Program network was 0.66 per 1,000 (95% CI: 0.02-3.67)<sup>(22)</sup>. There are two major limitations of these estimates: first, household contacts and attending physicians were not asked about the use of chemoprophylaxis; and second, these attack rates are based on extremely small numbers of subsequent cases and therefore may be unstable, as exemplified by the large confidence intervals<sup>(22)</sup>.

In a follow-up study of clusters identified through enhanced surveillance in England, Wales and Northern Ireland during 2003, five household clusters were identified. The clusters included two

spouse pairs and three mother-neonate pairs, which is in contrast to the clusters identified in the Ontario study (three spouse pairs, one adult sibling pair) and in US ABC surveillance (one father-infant daughter pair). According to the UK data, infections in either the mother or child in the neonatal period (first 28 days of life) were considered as carrying a high risk of further cases in the mother or baby. The risk estimates for other household contacts suggested that over 2,000 close contacts would need chemoprophylaxis to prevent a subsequent case, assuming 100% effectiveness of chemoprophylaxis<sup>(28)</sup>.

- ***The risk of subsequent infection for non-household close contacts has not been quantified, but there is a reasonable theoretical risk that invasive GAS disease can be transmitted to these persons.***

There is little evidence that GAS has been transmitted to non-household close contacts after unprotected direct contact, prolonged mucous membrane contact or contact with oral or nasal secretions of a case; however, this was felt to be biologically plausible and was therefore included. Direct mucous membrane contact should be prolonged for a person to be considered this type of non-household close contact. This would include close contact, such as mouth-to-mouth resuscitation or open mouth kissing, but exclude kissing with closed mouths and sharing of utensils, water bottles or cigarettes. A firefighter developed toxic shock syndrome and cellulitis within 24 hours of performing cardiopulmonary resuscitation on a child with STSS using a bag-valve mask apparatus. The close temporal relation and the isolation of the same GAS strain from the child's blood and CSF and from the hand wound of the firefighter suggest the transmission of GAS during resuscitation or while cleaning secretions from the resuscitation equipment<sup>(29)</sup>.

Three Swiss studies have demonstrated the occurrence of clusters of clonal strains causing endemic or epidemic infection among injection drug users living or purchasing drugs in the same region<sup>(30-32)</sup>. A case report from Israel reported the occurrence of invasive GAS isolates of the same serotype in a couple who regularly shared needles for injecting drugs<sup>(33)</sup>.

Several studies have shown that, compared with rates in the general population, rates of pharyngeal carriage of the same strain of GAS are higher among close contacts spending at least 24 hours with an index case in the week preceding onset of illness<sup>(34)</sup>, among residents and staff at the LTCF of the case<sup>(35,36)</sup> and among children sharing the same room as a case in a child care centre<sup>(37-39)</sup>. Asymptomatic pharyngeal carriage or acute streptococcal pharyngitis among such persons may contribute to the spread of invasive infection.

■ ***Decisions about chemoprophylaxis must take into account the individual and population risks and benefits of this intervention.***

While prophylaxis of close contacts may be intuitively attractive, there is limited evidence that such prophylaxis is effective, and it is possible that prophylaxis may not be uniformly effective because of widespread transmission of *S. pyogenes* in the community.

The consequences of prophylaxis must also be considered. Serious adverse effects associated with the antibiotics used for prophylaxis are very rare but do occur. In addition, use of antibiotics clearly selects for antibiotic resistance and may have an impact on antibiotic resistance patterns. Finally, contact tracing and follow-up affect public health resources, which are scarce and must be directed to where they have the greatest benefit.

Based on an estimate that approximately 300 close contacts of an invasive GAS case would need to receive chemoprophylaxis to prevent one secondary case, that there would be an average of 10 contacts per case, a retail cost of \$30 per person for antibiotics and approximately 3 hours of public health nurse follow-up time per case, at \$50 per hour, the cost-effectiveness has been estimated to be \$13,500 CAD in direct health care costs per secondary case prevented. This cost-effectiveness is within the range of other recommended public health preventive measures<sup>(40)</sup>.

On the basis of these considerations, the working group consensus is that chemoprophylaxis is indicated only for contacts at the highest risk of

acquisition of the organism and of subsequent severe disease. This explains why prophylaxis is not routinely recommended for contacts of cases that are not severe (see Table 2) (e.g. bacteremia or septic arthritis). Such cases have milder disease than others with invasive GAS, and their contacts are also likely to have milder disease, as there is some degree of consistency in the type and severity of disease caused by a particular GAS strain. The level of risk may vary for different groups, and there may be individual circumstances under which different decisions regarding chemoprophylaxis may be made.

The approach for contact management and recommended chemoprophylaxis varies by country<sup>(27,28)</sup>. The uncertainties in this decision-making process also explain why recommendations from various authorities will continue to differ, and as additional evidence becomes available these guidelines may need to be revisited.

**Table 5. Recommendations for Contact Management**

- Chemoprophylaxis should only be offered
  - to close contacts (see Table 3) of a confirmed severe case (see Table 2), that is, a case of STSS, soft-tissue necrosis (including NF, myositis or gangrene), meningitis, GAS pneumonia, other life-threatening conditions or a confirmed case resulting in death; AND
  - if close contacts have been exposed to the case during the period from 7 days prior to onset of symptoms in the case to 24 hours after the case's initiation of antimicrobial therapy.
- Chemoprophylaxis of close contacts should be administered as soon as possible and preferably within 24 hours of case identification but is still recommended for up to 7 days after the last contact with an infectious case.
- Close contacts of all confirmed cases (i.e. regardless of whether the case is a severe one) should be alerted to signs and symptoms of invasive GAS disease and be advised to seek medical attention immediately should they develop febrile illness or any other clinical manifestations of GAS infection within 30 days of diagnosis in the index case.

***Follow-up of contacts***

Cultures for GAS have no role in the identification of asymptomatic close contacts of sporadic cases occurring in the community. The only reason for obtaining cultures for GAS is in the diagnosis of suspected infection. There is no role for routine

culture for a test of cure for contacts receiving antibiotic chemoprophylaxis.

### 6.3 Long-term care facilities

Residents of LTCF are at increased risk of morbidity and mortality due to invasive GAS disease because of their older age and higher prevalence of underlying conditions<sup>(36,41-43)</sup>. When a culture-confirmed case of invasive GAS disease occurs in an LTCF, there is a 38% likelihood that a second, positive blood culture-confirmed case of the same strain will be detected in the facility within 6 weeks (Dr. A. McGeer, Mount Sinai Hospital, Toronto: personal communication, July 2005). A number of outbreaks of invasive GAS infections have been documented in LTCF<sup>(23,36,42-46)</sup>. Infection is often spread through person-to-person contact, with clustering of cases by room or care unit in some instances<sup>(23,36,42,43,46)</sup>. Staff may be a source of or conduit of infection either through poor infection control practices or asymptomatic carriage<sup>(35,42,44,45)</sup>. However, hospital staff who are carriers are more likely to be the source of infection in outbreaks in acute care facilities, whereas outbreaks in LTCF are more often patient-propagated<sup>(23)</sup>. In LTCF outbreaks, the implicated strain is usually widespread within the facility, and limited provision of chemoprophylaxis to close contacts is not the optimal approach.

In addition to strict enforcement of standard infection control practices, the following approach may be useful in the investigation and control of invasive GAS disease in LTCF:

- When a confirmed case of invasive GAS disease (as described in Section 5.1) occurs in an LTCF such as a nursing home, the facility should
  - report the case to the local health authorities;
  - conduct a retrospective chart review of the entire facility's residents over the previous 4 to 6 weeks for culture-confirmed cases of GAS disease and any suggested cases of non-invasive or invasive GAS infection, including skin and soft tissue infections (e.g. pharyngitis and cellulitis) and excluding pneumonia and conjunctivitis not confirmed by culture. An
- excess of GAS infection, or an LTCF outbreak, is defined in Table 4;
- assess the potential for a source of infection from outside the facility (e.g. regular visits from children who have recently been ill).
- If an excess of GAS infection is identified, the following actions should be considered:
  - all patient care staff should be screened for GAS with throat, nose and skin lesion cultures. In LTCF with < 100 beds, all residents should be screened for GAS. In LTCF with 100 beds or greater, screening can be limited to all residents within the same care unit as the infected case and contacts of the case if necessary, unless patient and care staff movement patterns or epidemiologic evidence (e.g. from the chart review) suggest that screening should be conducted more broadly;
  - anyone colonized with GAS should receive chemoprophylaxis (see Section 7.0);
  - non-patient care staff should be asked about possible recent GAS infections. Those with a positive history should be screened for GAS, and those who are positive should be treated with antibiotics as per the recommended regimen;
  - all GAS isolates should have further typing (see Annex 2: Laboratory Support for Outbreak Investigation of Invasive GAS, for further details). Culture for a test of cure is recommended for individuals found to have the outbreak-related strain, particularly if there is epidemiologic evidence indicating that contact with the individual is significantly related to illness. Culture for a test of cure is not necessary for individuals infected with a strain of GAS not related to the outbreak.
  - all GAS positive residents and staff should be re-screened, including throat and skin lesion(s), 14 days after chemoprophylaxis has been started; this should be followed by screening at 2 weeks and at 4 weeks after the first re-screening. If the person is found to be positive, a second course of chemoprophylaxis should be offered. If the person is still

colonized after the second course, discontinue chemoprophylaxis unless the facility has an ongoing problem with GAS infection;

- active surveillance for GAS infection should be initiated and continued for 1 to 2 months;
- appropriate specimens should be taken for culture to rule out GAS when suspected infections are detected by active surveillance.
- If no excess is identified, especially if there is evidence of an outside source of infection for the index case, then active surveillance alone for 2 to 4 weeks to establish the absence of additional cases is warranted.

Disease control measures for invasive GAS disease occurring in other health care settings are described in Annex 3.

## 6.4 Child Care Centres

For the purposes of these guidelines, child care centres include group or institutional child care centres (day care), family or home day care and pre-schools. Non-invasive GAS infection can spread easily in child care centres (CCC)<sup>(38)</sup>; however, outbreaks of invasive GAS disease occurring among children attending CCC are rare. The recommendations for invasive GAS disease in CCC are therefore based on expert opinion and very limited evidence.

In two CCC outbreaks in the United States, GAS infection or carriage of the same serotype as the index case was detected in 8% to 18% of other attendees. The risk of GAS infection or carriage was associated with sharing a room with the index case and spending a greater number of hours per week at the CCC. GAS prevalence among staff was low in both outbreaks, suggesting that they did not contribute to the spread of infection<sup>(37,39)</sup>.

Invasive GAS disease in children frequently occurs secondary to varicella infection<sup>(20,47-52)</sup>. Two population-based Canadian studies have shown that 15% to 25% of pediatric cases of invasive GAS disease are associated with antecedent varicella infection<sup>(20,50)</sup>. The risk is significantly increased during the 2-week period after the onset of varicella infection and may

be due to a breakdown in the skin barrier, infection through another less apparent portal, such as lesions on the oral mucosa or the respiratory tract, or immunosuppression<sup>(50)</sup>. The National Advisory Committee on Immunization (NACI) recommends varicella vaccination for children between 12 and 18 months of age and for susceptible persons  $\geq$  12 months of age<sup>(53)</sup>. It has been estimated that the full implementation of universal childhood varicella vaccination could prevent at least 10% of pediatric invasive GAS cases in Canada<sup>(50)</sup>. Outbreaks of invasive GAS and varicella have been previously reported to occur concurrently among children<sup>(37,49,54)</sup>. According to NACI guidelines, post-exposure use of varicella vaccine should be considered during an outbreak of varicella in a child care facility<sup>(53)</sup>. Varicella vaccination of susceptible attendees may help prevent the further spread of a concurrent outbreak of invasive GAS disease<sup>(37,49)</sup>.

In addition to strict enforcement of standard infection control practices<sup>(55)</sup>, staff from the affected CCC must report to local health authorities when a confirmed case of invasive GAS disease (as described in Section 5.1) occurs in a child attending the CCC. This may be required by legislation in some provinces and territories.

Health authorities should investigate when one severe case of invasive GAS disease (see Table 2) occurs in a child attending a CCC. Investigators should take into consideration the following:

1. the nature of the CCC (e.g. type of centre, including the size and physical structure, number and ages of the children, type of interaction of the children);
2. the characteristics of the case (e.g. if the case occurred secondary to a varicella infection);
3. the potential for a source of infection from within the CCC:
  - a. whether there has been any suggested non-invasive or invasive GAS infections (e.g. other cases of invasive GAS, pharyngitis, impetigo);

- b. potential of a point source of infection (foodborne outbreaks of pharyngitis have occurred and are a consequence of human contamination of food in conjunction with improper preparation or refrigeration procedures<sup>(25)</sup>);
- 4. the presence of varicella cases within the CCC in the previous 2 weeks;
- 5. the potential for a source of infection from outside the CCC (e.g. exposure to a family member with suggested non-invasive or invasive GAS infection).

The following approach should be considered in the investigation and control of invasive GAS disease when one severe case of invasive GAS disease (see Table 2) occurs in a child attending a CCC:

- Parents and/or guardians of attendees should be informed of the situation, alerted to the signs and symptoms of invasive GAS disease and be advised to seek medical attention immediately should their child develop febrile illness or any other clinical manifestations of GAS.
- In family or home day care settings, chemoprophylaxis should be recommended for all children and staff (see Section 7.0).
- In group or institutional CCC and pre-schools, chemoprophylaxis is generally not warranted but may be considered in certain situations, including the occurrence of > 1 case of invasive GAS disease in children or staff of the CCC within 1 month or a concurrent varicella outbreak at the CCC. Cases of invasive GAS occurring among children or staff of a CCC within 1 month should be considered as part of the same cluster. Consideration could be given to testing isolates from invasive GAS cases occurring in a CCC more than 1 month apart, to determine strain relatedness. If a case of varicella has occurred in the CCC within the 2 weeks before onset of GAS symptoms in the index case, all attendees should be assessed for varicella vaccination history. Two weeks was chosen as the time interval on the basis of findings that risk of GAS was significantly increased 2 weeks after

onset of varicella infection<sup>(50)</sup>. Varicella vaccination should be recommended for those without a history of prior varicella infection or vaccination as per the NACI guidelines<sup>(53)</sup>.

- A test of cure is not warranted for persons receiving chemoprophylaxis.
- It should be emphasized that staff of the CCC must notify local public health officials if further cases of invasive GAS infection occur. This may be required by legislation in some provinces and territories.
- Appropriate specimens can be taken for culture to rule out GAS when suspected infections are detected during this period; however routine screening of attendees is not recommended.

## 7.0 Recommendations for Chemoprophylaxis

The objective of chemoprophylaxis is to prevent disease in colonized individuals and in those who have recently been exposed, thereby decreasing transmission of a strain known to cause severe infection.

The recommendations for chemoprophylaxis regimens have been extrapolated from treatment guidelines for acute GAS pharyngitis and evidence from clinical trials for the eradication of pharyngeal GAS colonization. Currently, there are no studies that have specifically assessed the effectiveness of chemoprophylaxis for the prevention of subsequent cases of invasive GAS disease, although antibiotic prophylaxis has been successfully used for outbreak control in LTCF in Canada and the United States<sup>(35,36,43,46)</sup>. Further studies are needed.

First-generation cephalosporins, such as cephalexin, are the preferred antibiotic for GAS chemoprophylaxis. Second- and third-generation cephalosporins (e.g. cefuroxime axetil, cefixime) may also be considered, but they have a broader spectrum, increased likelihood of resistance and higher cost than first-generation cephalosporins<sup>(56,57)</sup>. Cephalosporins are more effective than penicillin in eradicating GAS

from pharyngeal carriers<sup>(56,58,59)</sup>. A meta-analysis of 35 trials involving 7,125 pediatric patients with GAS tonsillopharyngitis showed that the bacteriologic cure rate significantly favoured cephalosporins compared with penicillin (odds ratio [OR] = 3.02, 95% CI: 2.49-3.67) after 10 days of treatment. Eight of 11 individual cephalosporins showed superior bacteriological cure rates among children. The summary OR for clinical cure rate was 2.33 (95% CI: 1.84-2.97)<sup>(60)</sup>. A meta-analysis of nine randomized controlled trials with adult patients showed that the bacteriologic eradication rate was nearly two times higher for cephalosporins than penicillin for the treatment of acute GAS tonsillopharyngitis after 10 days of treatment (summary OR = 1.83, 95% CI: 1.37-2.44); the clinical cure rate also favoured cephalosporins (summary OR = 2.29, 95% CI: 1.61-3.28)<sup>(57)</sup>. Cephalosporins are acceptable for penicillin-allergic patients who do not manifest immediate-type hypersensitivity to beta-lactam antibiotics<sup>(61)</sup>.

The macrolides erythromycin and clarithromycin are suitable alternative agents that have been shown to be clinically effective for treatment of GAS pharyngitis<sup>(62-67)</sup>. However, macrolide resistance is a concern in Canada. According to surveillance data for invasive GAS submitted to NCS, erythromycin resistance has been relatively stable over the past 4 years, ranging from 9.8 to 11.1%<sup>(14-16)</sup>. In areas where macrolide resistance is either unknown or known to be  $\geq 10\%$ , testing of the GAS isolate is recommended to determine appropriate treatment.

Clindamycin is another alternative agent recommended for patients infected with an erythromycin-resistant strain of *S. pyogenes* who are unable to tolerate beta-lactam antibiotics<sup>(61)</sup>. A 10-day regimen of orally administered clindamycin (20 mg/kg per day) was effective in eradicating GAS from the oropharynx of persistently colonized, asymptomatic children (92%, 24/26) in a randomized, unblinded, controlled clinical trial<sup>(68)</sup>. Gallegos et al.<sup>(69)</sup> found that clindamycin regimens of either 150 mg 4 times per day or 300 mg 2 times per day were equally efficacious, with a clinical cure rate of 93% among adults with acute streptococcal tonsillitis/pharyngitis

in a double-blind, randomized, multicentre study. However, emergence of resistance would need to be monitored closely for this anti-microbial. In 2004-2005, 2.0% of GAS isolates tested for antimicrobial sensitivity at the NCS were resistant to clindamycin<sup>(16)</sup>, as compared with 1.6% of isolates in 2003-2004<sup>(15)</sup>, 1.9% in 2002-2003 and 0.9% in 2001-2002<sup>(14)</sup>.

Oral penicillin VK (or amoxicillin in young children) may be considered for GAS chemoprophylaxis because of its proven efficacy, safety, narrow spectrum and low cost<sup>(70)</sup>. However, penicillin is less effective in eradicating GAS from the upper respiratory tracts of chronic (asymptomatic) carriers. Carriers treated with penicillin are generally characterized by a lack of a serologic response and may account for a significant proportion of penicillin treatment failures<sup>(58,71-73)</sup>. Streptococcal internalization within epithelial cells may contribute to eradication failure and persistent throat carriage<sup>(74)</sup>. Some experts feel that penicillin should be considered an alternative first-line therapy, whereas other experts believe that penicillin monotherapy may be inferior on the basis of data from bacteriologic eradication in the treatment of GAS pharyngitis and in the eradication of carriage; however, the relevance of these data to chemoprophylaxis of contacts is unclear.

Azithromycin may be considered for the eradication of GAS from the pharynx using a shorter 5-day course<sup>(70,75)</sup>, but Canadian evidence has shown that azithromycin may select for macrolide resistance among streptococci more strongly than erythromycin and clarithromycin, and therefore it should not be considered as a first- or second-line therapy<sup>(76)</sup>.

The chemoprophylactic agents and dosages recommended for preventing disease and decreasing transmission of GAS are listed in Table 6. It is important to ensure that contacts requiring chemoprophylaxis complete the recommended course.

**Table 6. Recommended Chemoprophylaxis Regimens for Close Contacts**

| Drug                                                                 | Dosage                                                                                                                                                                                               | Comments                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| First-generation cephalosporins: cephalexin, cephadroxil, cephadrine | <b>First line.</b> Children and adults: 25 to 50 mg/kg daily, to a maximum of 1 g/day in 2 to 4 divided doses × 10 days                                                                              | Recommended drug for pregnant and lactating women. Should be used with caution in patients with allergy to penicillin.<br>Use of cephalosporins with nephrotoxic drugs (e.g. aminoglycosides, vancomycin) may increase the risk of cephalosporin-induced nephrotoxicity. |
| Erythromycin                                                         | <b>Second line.</b> Children: 5 to 7.5 mg/kg every 6 hours or 10 to 15 mg/kg every 12 hours (base) × 10 days (not to exceed maximum of adult dose)<br>Adults: 500 mg every 12 hours (base) × 10 days | Erythromycin estolate is contraindicated in persons with pre-existing liver disease or dysfunction and during pregnancy.<br>Sensitivity testing is recommended in areas where macrolide resistance is unknown or known to be ≥ 10%.                                      |
| Clarithromycin                                                       | <b>Second line.</b> Children: 15 mg/kg daily in divided doses every 12 hours, to a maximum of 250 mg po bid × 10 days<br>Adults: 250 mg po bid × 10 days                                             | Contraindicated in pregnancy.<br>Sensitivity testing is recommended in areas where macrolide resistance is unknown or known to be ≥ 10%.                                                                                                                                 |
| Clindamycin                                                          | <b>Second line.</b> Children: 8 to 16 mg/kg daily divided into 3 or 4 equal doses × 10 days (not to exceed maximum of adult dose)<br>Adults: 150 mg every 6 hours × 10 days                          | Alternative for persons who are unable to tolerate beta-lactam antibiotics.                                                                                                                                                                                              |

## 8.0 Vaccines

Currently, there are no vaccines approved for use in Canada for the prevention of GAS infections. There are a number of vaccines under development. Recent results of a phase I trial of a multivalent vaccine in the United States have demonstrated significant increases in antibody levels to all six component M antigens used in the vaccine among healthy adult volunteers<sup>(77)</sup>. Results of a phase I trial and preliminary results of a phase II trial for a multivalent vaccine in Canada have also shown high titres of antibodies to 26 targeted serotypes contained in the vaccine among healthy adult volunteers<sup>(78,79)</sup>. There was no evidence of tissue cross-reactive antibodies or vaccine-related serious adverse events among participants for either vaccine.

## 9.0 Communications

### 9.1 Communication pertaining to sporadic cases

In general, it is not necessary to inform the general public of a sporadic case, even if it involves a fatality. However, it is important that a communication strategy be prepared in advance in order to address any questions that may arise among those concerned with the control measures or if approached by the media. Details of the communication strategy need to be tailored to the context of the sporadic case (e.g. liaison with school authorities is important when a case is a student). This could include information on the disease and its characteristics, local epidemiology of GAS and recommended treatment and prophylactic measures.

## 9.2 Communication pertaining to clusters or outbreaks

It is essential that a communication strategy be in place to provide timely information to the public or local community when a cluster or outbreak occurs. A communication strategy aimed at the health care community should also be developed. This should include the criteria and the process for reporting to public health, timely surveillance reports and updates, guidelines on early diagnosis (including signs and symptoms) and recommended treatment and prophylactic measures. It is important to involve the health care community as early as possible after the recognition of an outbreak. The need for an outbreak advisory committee comprising public health representatives, clinicians and medical laboratory personnel should be evaluated.

In addition to the principles previously described, essential elements of a communication strategy include the following:

1. Wide consultation, including public health representatives, clinicians and laboratory personnel, before any decision is made;
2. Clearly designated responsibilities. A designated lead organization should be identified. Messages should be coordinated and consistent. The lead organization should be responsible for the announcement of the decision and the management of communications with respect to the operation of a control program;
3. Within each organization, one spokesperson should be responsible for communicating with the media.

## 10.0 Areas for Future Research

These public health guidelines for invasive GAS disease have been formulated through a consensus process involving public health officials, as well as experts in adult and pediatric infectious diseases and microbiology, and are based on limited evidence and expert opinion. Risk of subsequent infection among household contacts has been estimated on the basis

of very small numbers of subsequent cases in two studies; further studies are needed to quantify this risk more precisely. Studies should also be performed to assess the risk of subsequent infection among non-household close contacts. Although screening is generally not indicated for investigations of invasive GAS disease in CCC, it may be considered in applied research settings to provide further information on the epidemiology of GAS infections in CCC. There is a need to evaluate the efficacy of chemoprophylaxis of close contacts and the effectiveness of different approaches to prophylaxis. As additional evidence becomes available, these guidelines may need to be revisited.

### Laboratory Support for Outbreak Investigation of Invasive Group A Streptococcal Disease

The National Centre for Streptococcus (NCS) provides laboratory support for the investigation of clusters or outbreaks of invasive group A Streptococcus (GAS) disease. The decision to initiate this type of investigation rests with the local public health agencies. The investigation team should coordinate the shipment of isolates and required information to the NCS through its local provincial laboratory or designate laboratory. The local outbreak investigation team is asked to provide a brief written description of the event, and this should be forwarded, via the appropriate provincial laboratory or designated laboratory, to the NCS **in advance** of isolate submission. This facilitates a timely laboratory response. Isolates associated with outbreak investigation are given priority testing status, and reports are phoned or faxed to the submitters as soon as testing is complete. Preliminary results for isolates from an outbreak investigation should be available within 1 week.

Contact the NCS at:

Phone: (780) 407-8977; (780) 407-8937

Fax: (780) 407-8984

Email: m.lovgren@provlab.ab.ca; g.tyrrell@provlab.ab.ca

If the investigation is to include testing of contacts (i.e. characterization of non-invasive GAS isolates), arrangements for the primary culture of these specimens should be made through the local microbiology laboratories and/or the provincial laboratories. Isolates may then be forwarded to the NCS for further investigation. Submitters are encouraged to use the NCS submission form for all isolates. This document is available through the NCS Web site at [www.provlab.ab.ca](http://www.provlab.ab.ca) (Partners\National Centres\National Centre for Streptococcus\NCS Requisition Forms).

#### Characterization of *Streptococcus pyogenes* (GAS)

The analysis of GAS includes serologic and molecular techniques. The strain profile includes the identification of the M protein type and T protein, and anti-opacity factor testing for serum opacity factor-positive strains.

#### M typing

M protein is a significant virulence factor produced by GAS. It is a surface protein antigen that gives the organism the ability to resist phagocytosis as a way of evading the human immune response to infection. Traditional serologic characterization of M protein relies on an antigen-antibody reaction between the organism and M type specific antisera. The M antisera are inherently difficult to prepare (commercial reagents are not available), and consequently this specialized testing is offered in only six reference laboratories worldwide. There are 86 M protein types that have been officially classified by this serologic method. The testing is performed by immunodiffusion and, especially for less common M types, several steps may be required to classify the strain. The production of M protein is coded by the *emm* gene, and molecular analysis is able to classify a rapidly expanding number of *emm* types. The *emm* type corresponds to the M type (e.g. M1 = *emm* 1) when the strain belongs to one of the internationally recognized M types. However *emm* typing is able to classify a large number of strains for which traditional M antisera are not available. This makes *emm* typing a more specific tool.

### *T typing*

T protein is not a virulence factor, but it provides an additional serologic “marker” with which to differentiate strains. A GAS strain may carry one or more T antigens, and the same T pattern may be shared by several M or *emm* types. T typing is therefore a less specific typing method than M or *emm* typing; however, there is an association between the T pattern and the specific M or *emm* type. T typing is performed by observing the antigen-antibody reaction with specific T typing antisera.

### *SOF typing*

Serum opacity factor (SOF) is an enzyme that is produced by some M/*emm* types. It is an apoproteinase that is named for its ability to produce opacity when an extract of the strain is mixed with mammalian serum (horse serum is typically used). Some M types are known to be SOF positive and others are typically SOF negative (e.g. M1 is always SOF negative, and M22 is typically SOF positive). The opacity factor of SOF-positive strains may be typed by neutralization of the reaction using specific antisera. This is called anti-opacity factor (AOF) typing and, with few exceptions, the AOF type is consistent with the M/*emm* type.

### *sic gene typing of M1 strains*

Traditional fingerprinting techniques (e.g. pulsed field gel electrophoresis) are not specific enough to differentiate strains of the same M/*emm* type. However, for M1/*emm* 1 strains, which account for 20% to 30% of the invasive disease-causing strains each year in Canada, variation within the *sic* (streptococcal inhibitor of complement) gene may be used to provide further analysis of isolates associated with an outbreak. Utilization of this testing for specific investigations must be discussed with the NCS before isolates are sent.

## ANNEX 3

### Infection Control for Invasive Group A Streptococcus Infection in Hospitals

This document was developed for the use of health care workers (HCWs) to prevent the transmission of invasive group A streptococcus (GAS) in hospitals. Invasive GAS disease is defined as disease with isolation of GAS from a normally sterile site (Section 5.1 of these Guidelines). For recommendations on non-invasive GAS please refer to the Public Health Agency of Canada (PHAC) Infection Control Guideline: *Routine Practices and Additional Precautions for Preventing the Transmission of Infections in Health Care – Revision of Isolation and Precaution Techniques*<sup>(1)</sup>.

The recommendations in this document are based on PHAC infection control guidelines: *Routine Practices and Additional Precautions for Preventing the Transmission of Infections in Health Care – Revision of Isolation and Precaution Techniques*<sup>(1)</sup>, *Prevention and Control of Occupational Infections in Health Care*<sup>(2)</sup> and *Hand Washing, Cleaning, Disinfection and Sterilization in Health Care*<sup>(3)</sup>.

Some specific recommendations in this Annex may supersede existing PHAC infection control guidelines; they are based on new evidence, expert opinion and consensus. The recommendations in this Annex have been reviewed and endorsed by the PHAC Infection Control Guidelines Steering Committee. A glossary of terms is found at the end of the Annex.

#### Transmission of Invasive GAS in Health Care Settings

GAS is primarily spread by large droplet contact of the oral or nasal mucous membranes with infectious respiratory secretions or with exudates from wounds or skin lesions, or by direct or indirect contact of non-intact skin with exudates from skin or wounds

or infectious respiratory secretions<sup>(1)</sup>. Transmission between patients through contaminated hands and the reduction of transmission by handwashing was initially reported by Semmelweis in 1848<sup>(4)</sup>. Transmission by contaminated equipment or patient care products (e.g. bidets, multi-dose injection vials) has rarely been reported<sup>(5)</sup>.

The incubation period for invasive GAS infection has not been determined. The incubation period for non-invasive GAS infection varies according to the clinical syndrome, usually 1 to 3 days. The infection is communicable until 24 hours of effective antibiotic treatment has been completed.

Nosocomial infections accounted for 12% of all invasive GAS infections identified during prospective surveillance in Ontario from 1992 to 2000<sup>(6)</sup>. Although pre-existing GAS carriage by the patient may play a role in some cases of sporadic post-partum or postoperative infections, GAS may also be acquired from health care providers with symptomatic infection or asymptomatic carriage<sup>(5,8)</sup>. Hospital outbreaks of invasive GAS have been reported in a variety of patient groups (e.g. post-partum women and newborns, postoperative surgical patients, burn patients, neonatal intensive care patients, patients in geriatric wards)<sup>(5,8)</sup>. Some outbreaks have been associated with persistent carriage of GAS by asymptomatic health care providers (e.g. surgeons, obstetricians, anesthesiologists, nurses). The pharynx, vagina, rectum and/or specific areas of skin (e.g. scalp) have been sites of colonization<sup>(5,8,9)</sup>. Outbreaks of GAS infection have also occurred in exposed HCWs<sup>(5,10)</sup>.

## Infection Control Measures To Prevent Transmission of Invasive GAS in Health Care Institutions

The transmission of invasive GAS in hospitals and long-term care facilities is most effectively prevented by adherence to good hand hygiene and other routine practices at all times. In addition, for patients with invasive GAS infection, contact and droplet precautions are required until 24 hours of effective antibiotic therapy has been administered. As most cases of nosocomial invasive GAS are sporadic, it is important to recognize clinical presentations compatible with invasive GAS early and institute additional precautions while awaiting laboratory confirmation. Active surveillance for early identification of outbreaks may also be effective in preventing some cases. Prevention of a hospital outbreak of GAS infection requires very rapid investigation and intervention once a single hospital-acquired case has been identified<sup>(6,8)</sup>. For further information regarding infection control measures in long-term care facilities please see Section 6.3 of the Guidelines.

In order to effectively prevent the transmission of GAS from patient to patient, patient to HCW and/or HCW to patient, the following infection control practices are necessary:

- Consistent adherence to good hand hygiene practice.
- Use of routine practices at all times and for all patients, including wearing a surgical/procedure mask and eye protection or face shield when contamination of the mucous membranes is likely, for example when doing wound irrigation.
- In addition to routine practices at all times, applying contact and droplet precautions when caring for patients with known or suspected invasive GAS disease (Section 5.1 of the Guidelines) until 24 hours of effective

antimicrobial therapy is complete. For the purpose of infection control, GAS pneumonia with or without a positive blood culture is considered an invasive infection, although not identified as such for reporting.

- Ensuring that HCWs promptly report illness possibly due to GAS (pharyngitis, impetigo, wound or skin infections, cellulitis) and comply with policies regarding not working when ill with a potentially communicable disease.
- Investigating clusters and identifying and treating patients and staff members with symptomatic GAS infection.
- Patients who share a room with a patient with invasive GAS are not considered as exposed and do not require prophylaxis. Unusual circumstances, e.g. the roommate has had direct mucous or non-intact skin contact with infectious respiratory tract secretions or skin lesions of an infected patient, should be assessed on a case-by-case basis.

## Occupational Health Work Practices to Manage HCWs Exposed/Colonized/Infected with GAS (invasive or non-invasive infection)

### *Management of HCWs exposed to GAS*

- An occupational exposure of a HCW is defined as secretions from the nose, mouth, wound or skin infection of the infected case coming into contact with the mucous membranes or non-intact skin of the HCW from within 7 days before the onset of GAS until 24 hours of effective antibiotic therapy.
- If appropriate personal protective equipment was worn, there was no exposure.
- The risk of development of GAS infection in exposed HCWs and the utility and efficacy of prophylaxis for this group are unknown. HCWs who have an occupational exposure to a patient with GAS soft tissue necrosis (including necrotizing fasciitis, myositis or gangrene), toxic shock syndrome, meningitis, pneumonia, other

life threatening GAS disease or GAS disease resulting in death may be offered chemoprophylaxis (Tables 3 and 5 of the Guidelines). In this situation, screening and/or cultures for test of cure are not necessary. This recommendation differs slightly from current guidelines defined in Prevention and Control of Occupational Infections in Health Care<sup>(2)</sup>, which indicates that management may include laboratory investigation and prophylaxis as recommended by provincial/territorial guidelines. HCWs with an occupational exposure should be counselled about the symptoms associated with GAS and advised to seek care immediately if symptoms of GAS disease (skin infection, pharyngitis, unexplained fever) develop in the 21 days after exposure.

- An occupational exposure to a patient with a form of invasive GAS not listed above is not considered to pose a significant risk of serious disease in HCWs; if workers report a significant exposure to such patients, they should be counselled about the symptoms associated with GAS and advised to seek care immediately if symptoms of GAS disease (skin infection, pharyngitis, unexplained fever) develop in the 21 days after exposure.
- There are no modifications to work practices or work restrictions for HCWs exposed to GAS.
- No screening, treatment, modifications of work practices or work restrictions for HCWs in contact with a patient with a GAS infection are required when there has not been an occupational exposure.

#### *Management of HCWs colonized or infected with GAS*

- There are no modifications to work practices or work restrictions for HCWs who are colonized with GAS and are asymptomatic if they are not epidemiologically linked to patient transmission.
- Asymptomatic, colonized HCWs who are epidemiologically linked to transmission of GAS to patients resulting in invasive or non-invasive disease should be offered chemoprophylaxis (Table 6 of the Guidelines) and should be

excluded from patient care duties until 24 hours after the start of treatment with effective antibiotic therapy.

- HCWs with symptomatic GAS infection (invasive or non-invasive) should be offered therapy and should be excluded from patient care duties until 24 hours after the start of effective antibiotic therapy.
- HCWs with symptomatic GAS infection and colonized HCWs linked epidemiologically to an outbreak should be informed of the potential for transmission of GAS within households and be advised that symptomatic family members should seek medical evaluation.
- Local public health authorities should be notified of cases of invasive GAS disease or a suspected or confirmed outbreak of GAS as required by legislation.
- Infection control and occupational health should be notified immediately of a HCW with suspected or confirmed GAS disease (invasive or non-invasive) if the HCW worked while the infection was communicable or if there is any possibility that the infection might have been occupationally acquired.
- Occupationally acquired infections should be reported to provincial/territorial ministries of labour and/or workplace safety insurance boards, as required by legislation.

#### *Management of possible or confirmed GAS outbreaks in hospitals*

- If, within 1 month of an invasive GAS case, one or more possibly linked additional invasive or non-invasive cases occur in either patients or staff, the situation should be treated as an outbreak until typing results are available.
- Occupational Health, Infection Prevention and Control, and Public Health authorities should be notified and liaise if an outbreak is suspected or confirmed.
- As part of the outbreak investigation, specimens for culture (throat, rectal, vaginal, skin lesions, stoma sites) should be obtained from HCWs and

patients epidemiologically linked to the nosocomial GAS transmission. A thorough inspection of the skin should be done for HCWs who are epidemiologically linked to nosocomial GAS transmission and culture of lesion carried out as appropriate (there have been outbreaks associated with skin/scalp carriage)<sup>(5)</sup>.

- Patients and HCWs epidemiologically linked to transmission and identified as colonized by screening cultures should be promptly offered antibiotics to eradicate carriage (Table 6 of the Guidelines)<sup>(2,3)</sup>. Isolates should be obtained and typed (serotyping or another equivalent method) to identify relatedness (see Annex 2: Laboratory Support for Outbreak Investigation of Invasive GAS Disease).
- HCWs who are either colonized, symptomatic or infected with GAS and epidemiologically linked to transmission should be excluded from patient care duties until 24 hours after the start of effective antibiotic therapy and assessed for fitness to work. The type of patient/physical setting/work/hygiene practices and control measures that can be used should be assessed, and a follow-up schedule established<sup>(2,3)</sup>.

- Culture for a test of cure is recommended for individuals found to have the outbreak-related strain if there is epidemiologic evidence indicating that contact with the individual is linked to transmission. If the person remains colonized, investigation of the household contacts for carriage should be considered.
- HCWs and/or patients who are identified by outbreak investigations and whose isolates are identified by typing as not being part of the outbreak do not require any follow-up or test of cure cultures.
- For algorithms in cases of post-partum and post-surgical GAS disease, please refer to guidelines from the Centers for Disease Control and Prevention<sup>(8)</sup>.

## Glossary of Terms

**Additional precautions:** These precautions are required when routine practices are not sufficient to prevent transmission. They include contact, droplet and airborne precautions.

**Contact precautions:** Includes specific recommendations for personal protective equipment (such as gowns if clothing or forearms will have direct contact with the patient or contaminated environmental surfaces, and gloves upon entry into patient's room or bed space); proper use and disinfection of patient care equipment between patients; patient accommodation and transport.

**Contact transmission:** Includes direct contact, indirect contact and droplet (large droplet) transmission as described below. Although droplet transmission is a type of contact transmission, it is considered separately as it requires different precautions.

- **Direct contact** occurs when the transfer of microorganisms results from direct physical contact between an infected or colonized individual and a susceptible host (body surface to body surface).
- **Indirect contact** involves the passive transfer of microorganisms to a susceptible host via an intermediate object such as contaminated hands that are not washed between patients, contaminated instruments or other inanimate objects.

**Droplet precautions:** Includes specific recommendations for personal protective equipment (including masks within 1 metre of the patient); patient accommodation and transport.

**Droplet transmission:** Refers to large droplets, greater than or equal to 5  $\mu\text{m}$  in diameter, generated from the respiratory tract of the source patient during coughing or sneezing, or during procedures such as suctioning or bronchoscopy. These droplets are propelled a short distance, < 1 metre, through the air

and deposited on the nasal or oral mucosa of the new host.

**Exposed HCW:** To be considered an exposed HCW, secretions from the nose, mouth, skin lesions or wound of the infected case have to come in contact with the mucous membranes or non-intact skin of the HCW.

**Hand hygiene:** A general term that applies either to handwashing, an antiseptic handwash, an antiseptic hand rub, or a surgical hand antisepsis.

**Mask:** A barrier covering the nose and mouth to protect the mucous membranes from splashes or sprays and from microorganisms contained in large droplet particles (> 5  $\mu\text{m}$  in size). Masks may also be used by the source patient to contain large droplet particles generated by coughing or sneezing. The term mask in this document refers to surgical/procedure masks, not to special masks such as high efficiency dust/mist masks or respirators.

**Nosocomial infection:** An infection is considered nosocomial or hospital-acquired if the disease was neither present nor incubating at the time of hospital admission.

**Routine practices:** Routine practices are infection prevention and control practices for use in the routine care of all patients and are dependent on the task being performed and the health care setting. Routine practices outline the importance of hand-washing before and after caring for patients; the need to use gloves, masks and eye protection or face shield, and gowns when splashes or sprays of blood, body fluids, secretions or excretions are possible; the cleaning of patient care equipment; the patient's physical environment; accommodation requirements for specific patients; management of soiled linens; and precautions to reduce the possibility of HCW exposure to bloodborne pathogens by sharp objects.

## 9.3.1 Invasive Meningococcal Disease (IMD)

### Special Precautions/Considerations

Precautions: Droplet

#### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Infectious Agent</b>      | <i>Neisseria meningitidis</i> ( <i>N. meningitidis</i> ), also called meningococcus, is a gram-negative aerobic diplococcus with at least 13 serogroups. Strains belonging to groups A, B, C, Y and W-135 are most commonly implicated in invasive disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Clinical Presentation</b> | <p>Sudden onset of fever, intense headache, nausea and often vomiting, stiff neck and photophobia. In infants and young children, symptoms may also include irritability, poor feeding and drowsiness.</p> <p>Meningococcemia, or meningococcal sepsis, is the most severe form of infection with petechial rash, hypotension, disseminated intravascular coagulation and multi-organ failure.</p> <p>Other clinical manifestations may include orbital cellulitis, septic arthritis, pericarditis or pneumonia with bacteremia.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Diagnostics</b>           | <p>Laboratory Criteria for Diagnosis requires the isolation of <i>N. meningitidis</i> by culture from a normally sterile site (e.g. blood or cerebrospinal fluid or, less commonly, joint, pleural or pericardial fluid).</p> <p>Confusion sometimes arises in determining whether a swab or aspirate is sterile or superficial (i.e. not from a sterile site). Generally the only swabs which are from sterile sites are those which are taken in the operating room during surgery – if this is not the case, it is unlikely that the isolate is from a sterile site. Aspirates are usually from sterile sites; an aspirate culture can be obtained through needle aspiration or during a percutaneous drainage procedure.</p> <p>It is essential to note that <b>only invasive disease is reportable</b>. Isolation of <i>N. meningitidis</i> from eye swab or sputum should also be reported.</p> <p>Although they are not reportable, from a case management perspective, the management of contacts of cases with conjunctivitis or pneumonia is the same as for contacts of invasive cases (refer to Contact Management section).</p> <p>Follow your regional laboratory procedures for serologic testing.</p> |
| <b>Treatment</b>             | A discussion of the treatment of Invasive Meningococcal Disease (IMD) is beyond the scope of these guidelines. The case should be referred to an expert for further management.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Occurrence</b>            | <p><b>Worldwide:</b> Endemic meningococcal disease occurs with an estimated 500,000 cases each year. The greatest incidence is during winter and spring. Epidemics are irregular. Disease occurs commonly in children and young adults, more males than females, and more commonly, among newly aggregated adults under crowded living conditions.</p> <p><b>Canada:</b> IMD is endemic with periods of increased activity that occur about every 10 to 15 years, with no consistent pattern. The incidence of IMD varies</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                                      | <p>with different serogroups, age groups, locations and time. From 2002 to 2008 the rate of IMD in Canada has remained fairly steady at an average of 0.6 cases per 100,000 population.</p> <p><b>Nunavut:</b> From 1999-2011 there have been under 5 cases of IMD per year, for this time frame there has been a yearly average of 1.3 cases per 100,000. Cases generally occur in children (under 3 years) and are subtype B; there is no consistent pattern by geographic region.</p>                                                                                                                                                                                                                                                                                                                        |
| <b>Reservoir</b>                     | Humans. Up to 5–10% of people may be asymptomatic carriers with nasopharyngeal colonization of <i>N. meningitidis</i> . Less than 1% of those colonized will progress to invasive disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Transmission</b>                  | Person-to-person by direct contact with saliva or respiratory secretions. The likelihood of person-to-person transmission is related to the nature and duration of contact; close and prolonged contact, such as kissing, sneezing and sharing eating/drinking utensils facilitates the spread of disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Incubation Period</b>             | Usually 3 to 4 days, ranges from 2 to 10 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Communicability</b>               | <p>Communicable from 7 days before the onset of symptoms to 24 hours after the initiation of appropriate antibiotic therapy.</p> <p>The period of communicability is difficult to determine in asymptomatic carriers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Susceptibility and Resistance</b> | <p>Susceptibility to clinical disease is low and decreases with age, which induces a high ratio of carriers to cases. Persons who are deficient in certain complement components are especially prone to recurrent disease. Asplenic and individuals who have received cochlear implants are susceptible to bacteremic illness. Group-specific immunity of unknown duration follows even in sub-clinical infections.</p> <p>People living in the same household as an IMD case are at 500 to 1200-fold greater risk of developing IMD than the general population. The risk of secondary disease among close contacts is highest during the first few days after the onset of disease in the index case.</p>                                                                                                    |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Case</b>                          | <p>Contact and interview the case. If the case is too ill to be interviewed, information should be obtained from family, health care providers, etc. Close contacts may be at increased risk for IMD. Work with the case to identify and follow all close contacts (refer to Contact Management section).</p> <p>Complete the <a href="#">Bacterial Disease Surveillance Form– <i>Neisseria meningitidis</i></a> dated February 2011 or later (section 9.3.2).</p>                                                                                                                                                                                                                                                                                                                                              |
| <b>Contacts</b>                      | <p>Because of the severity of IMD and the increased risk of infection among close contacts (see below) of sporadic cases, aggressive contact tracing is essential to identify close contacts at increased risk of disease.</p> <p>The management of contacts of cases with conjunctivitis or pneumonia is the same as for contacts of invasive cases. The main components of IMD contact management include: <a href="#">See contact investigation form</a>.</p> <ol style="list-style-type: none"> <li>1. Identify and find all close contacts;</li> <li>2. Educate and counsel all close contacts;</li> <li>3. Offer prophylactic antibiotic therapy to all close contacts; and</li> <li>4. Offer vaccine to all close contacts, if indicated (if the strain is deemed to be vaccine preventable).</li> </ol> |

### 1. Identify and Find All Close Contacts

Close contacts are defined as individuals who had the following type(s) of contact with the case during their infectious period (i.e. in the 7 days prior to symptom onset to 24 hours after the initiation of appropriate antibiotic therapy):

- Household contacts of the case;
- Persons who shared sleeping arrangements with the case;
- Non-household contacts who had sexual contact with the case;
- Persons who have had direct contamination of their nose or mouth with the oral/nasal secretions of the case (e.g. kissing on the mouth, shared cigarettes, shared drinking bottles, etc.);
- Health care workers who have had intensive unprotected contact (without wearing a mask) with the case (e.g. intubating, resuscitating or closely examining the oropharynx);
- Children and staff in child care and nursery school facilities; and
- Airline passengers sitting immediately on either side of the case (but not across the aisle) when the total time spent aboard the aircraft was at least 8 hours.

**Note:** School classmates, work colleagues, as well as social or sports contacts of a case are usually not considered close contacts unless they fit into one of the above categories.

### 2. Educate and Counsel All Close Contacts

People living in the same household as an IMD case are at 500 to 1200-fold greater risk of developing IMD than the general population. The risk of secondary disease among close contacts is highest during the first few days after the onset of disease in the index case. Provide counselling and education to close contacts about:

- The risk of disease and need for prophylaxis;
- The signs and symptoms to recognize;
- The need to seek immediate medical attention should they develop febrile illness or other symptoms of IMD; and
- Information on the prophylactic antibiotic.

### 3. Offer Antibiotic Prophylaxis to All Close Contacts

- Individuals defined as close contacts should be offered prophylactic antibiotics, regardless of their immunization status. Prophylaxis should be given as soon as possible, preferably within 24 hours of case identification and up to 10 days after the last contact with the case. Antibiotics will be provided free of charge.
- Chemoprophylaxis is not recommended for casual contacts such as school, workplace or social contacts, as they are not considered close contacts unless they fit into one of the categories detailed above.

#### Recommended Chemoprophylaxis Regimens for Close Contacts\*

| Drug          | Dosage                                                        | Comments                                                                                                                                                                                               |

| <p>*For the management of selected child care or hospital contacts, refer to the <i>Guidelines for the Prevention and Control of Meningococcal Disease</i> (see Reference section).</p> <p><b>4. Offer Vaccine to All Close Contacts (if indicated)</b></p> <p>Vaccination of susceptible close contacts, in addition to chemoprophylaxis, should be considered when the serogroup is vaccine preventable as it may further reduce the risk of subsequent meningococcal disease; vaccination should be carried out as soon as possible. The decision to immunize contacts will be made by the Chief Medical Officer of Health (CMOH) once the group of meningococcus is reported by the laboratory.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                            |                                                                                                                                                                                                                                           |

## 1.0 Introduction

Guidelines for the control of meningococcal disease were last published in 1994, following a 1993 Canadian Consensus Conference on Meningococcal Disease<sup>(1)</sup>. Since that time, meningococcal C conjugate vaccines have been licensed. These revised guidelines provide updated case definitions and public health control measures, taking into account new advances in diagnostic and vaccine technology.

## 2.0 Objectives

These guidelines have been prepared to assist in the public health investigation and management of sporadic cases, outbreaks and persistently elevated rates of invasive meningococcal disease (IMD) in Canada. The guidelines address the following:

- surveillance and reporting;
- public health response to sporadic cases, including those aboard airplanes;
- chemoprophylaxis and immunoprophylaxis of close contacts;
- outbreak control;
- communication strategies.

## 3.0 Epidemiology of Invasive Meningococcal Disease in Canada

Updates on the epidemiology of IMD are published periodically in the Canada Communicable Disease Report (CCDR) and in the National Advisory Committee on Immunization (NACI) meningococcal vaccine statements. The most recent report was published in February 2004<sup>(2)</sup>. Readers are referred to these reports for more detailed information.

Meningococcal disease is endemic in Canada, periods of increased activity occurring roughly every 10 to 15 years with no consistent pattern. The incidence rate of meningococcal disease has varied considerably with different serogroups, age groups, geographic locations and time. The last major epidemic, due to serogroup A, occurred in 1940-1943, when the peak incidence rate was close to 13 per 100,000 population per year. Since then the overall incidence of disease has remained at or below 2 per 100,000 per year (range 0.5 to 2.1)<sup>(2,5)</sup>. There were sporadic localized outbreaks and periods of elevated incidence of serogroup C disease during 1989-1993 and 1999-2001<sup>(2,3)</sup>. Immunization campaigns using serogroup C polysaccharide and conjugate vaccines were implemented in some regions during that period.

Case-by-case data for IMD in Canada are available from 1985 to 2001. During this period, an average of 305 cases of meningococcal disease were reported annually. Overall, the incidence rate has been highest among children  $\leq$  1 year of age, and then it declines as age increases except for a smaller peak in the 15- to 19-year age group. Disease occurs year round, but there is seasonal variation with the majority of cases occurring in the winter months.

Of the small numbers of isolates characterized from 1971 to 1974, *Neisseria meningitidis* serogroups A and C were most frequently identified<sup>(6)</sup>. From 1975 to 1989, serogroup B predominated. The majority were serotype 2b, 4 and 15, and the most common subtype was P1.2<sup>(7)</sup>. In 1986, a new clone of serogroup

C, serotype 2a characterized by multilocus enzyme electrophoresis (MLEE) as electrophoretic type 15 (ET-15), was identified in Canada for the first time<sup>(7)</sup>. Since then serogroups B and C have been responsible for most of the cases of endemic disease in Canada. Serogroup C isolates have almost exclusively been responsible for outbreaks in schools and communities. In addition, IMD caused by serogroup C has had a higher case fatality ratio and a greater incidence among adolescents than disease caused by serogroup B.

## 4.0 Definitions

### 4.1 National Case Definition

**Table 1**

|                       |                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Confirmed Case</b> | Invasive disease <sup>1</sup> with laboratory confirmation of infection:<br>! isolation of <i>N. meningitidis</i> from a normally sterile site (blood, cerebrospinal fluid [CSF], joint, pleural or pericardial fluid); OR<br>! demonstration of <i>N. meningitidis</i> DNA by appropriately validated nucleic acid test (NAT) <sup>2</sup> from a normally sterile site. |
| <b>Probable Case</b>  | Invasive disease <sup>1</sup> with purpura fulminans or petechiae and no other apparent cause:<br>! with demonstration of <i>N. meningitidis</i> antigen in the CSF; OR<br>! in the absence of isolation of <i>N. meningitidis</i> or demonstration of DNA by appropriately validated NAT <sup>2</sup> from a normally sterile site.                                      |

<sup>1</sup>Invasive meningococcal disease usually manifests itself as meningitis and/or septicemia, although other manifestations may be observed (e.g. orbital cellulitis, septic arthritis). Invasive disease may progress rapidly to purpura fulminans, shock and death.

<sup>2</sup>Each jurisdiction will have a validation process for the NAT that they have in place.

Both confirmed and probable cases of IMD are notifiable at the national level. The national case definition underwent revision in 2005. The new case definition will become effective 1 January, 2006 and now includes demonstration of *N. meningitidis* DNA by appropriately validated nucleic acid test (NAT) from a normally sterile site. Meningococcal DNA can be found in the CSF up to 96 hours after antibiotics have been started<sup>(8)</sup>.

### 4.2 Definitions for Public Health Management

For the public health management of sporadic cases, outbreaks and persistently elevated rates of disease, the following definitions have been developed.

#### 4.2.1 Cases and Contacts

Tables 2 and 3 provide definitions of cases and close contacts.

**Table 2: Description of Cases**

|                      |                                                                                                                                        |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Sporadic Case</b> | A single case occurring in a community where there is no evidence of an epidemiologic link (by person, place or time) to another case. |
| <b>Index Case</b>    | The first case occurring in a community.                                                                                               |

|                        |                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Subsequent Case</b> | A case with onset of illness subsequent to another case with whom an epidemiologic link can be established. This category includes <b>co-primary cases</b> (a person who develops illness within 24 hours of onset of illness in the index case), as well as <b>secondary cases</b> (a person developing illness > 24 hours after onset of illness in the index case). |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

An epidemiologic link can be established when a person has one or both of the following in common with a confirmed case:

- contact with a common, specific individual (including confirmed or probable cases),
- presence in the same location (e.g. work, school, a bar or party) at or around the same time.

**Table 3: Definition of Close Contacts**

- |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>! Household contacts of a case</li> <li>! Persons who share sleeping arrangements with the case</li> <li>! Persons who have direct contamination of their nose or mouth with the oral/nasal secretions of a case (e.g. kissing on the mouth, shared cigarettes, shared drinking bottles)</li> <li>! Health care workers (HCWs) who have had intensive unprotected contact (without wearing a mask) with infected patients (e.g. intubating, resuscitating or closely examining the oropharynx)</li> <li>! Children and staff in child care and nursery school facilities</li> <li>! Airline passengers sitting immediately on either side of the case (but not across the aisle) when the total time spent aboard the aircraft was at least 8 hours (see section 7.1.4)</li> </ul> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

For public health management, cases that occur after the index case with which an epidemiologic link can be established may have acquired the disease directly from the index case or from another common source. Subsequent cases can be early, intermediate or late. Subsequent cases that occur early (within 24 hours), termed co-primary cases, most likely acquired the disease from a common source. Conversely, subsequent cases that occur after 24 hours, or secondary cases, may have acquired the disease in either fashion.

The likelihood of person-to-person transmission of meningococcal disease is related to both the nature and duration of the contact with a confirmed case. Studies carried out before the routine use of chemoprophylaxis have revealed that people who lived in the same household as an IMD case were at 500 to 1200 fold greater risk of IMD than the general population<sup>(9,10)</sup>. The risk is highest in the first week after onset of illness in a case and decreases thereafter<sup>(9,11)</sup>. Studies of transmission of IMD in child care facilities and nursery schools have been conflicting but suggest that there is an increased risk of secondary cases, although the risk is lower than in the household setting<sup>(9,12)</sup>. Increased risk of IMD has not been shown in casual contacts of sporadic cases<sup>(13-16)</sup>. Therefore school/classroom, transportation, workplace or social contacts are not considered as close contacts unless their specific relationship with the case identifies them as such (see Table 3).

Nosocomial transmission of IMD is very uncommon, especially when routine practices and (large) droplet and contact precautions are followed to prevent the transmission of IMD. In rare instances, direct contact with respiratory secretions of infected persons (e.g. during mouth-to-mouth resuscitation) has resulted in transmission to HCWs. A pediatrician in France developed IMD a week after intubating a comatose child with meningococcal disease<sup>(17,18)</sup>. Therefore, HCWs are considered as close contacts if they have had intensive, unprotected contact (without wearing a mask) with infected patients (e.g. intubating, resuscitating or closely examining the oropharynx)<sup>(19)</sup>.

In certain countries, such as Canada, where chemoprophylaxis of close contacts is routinely administered for sporadic cases, 0.3% to 3% of cases of meningococcal disease occur in contacts of the index case<sup>(10,11,20,21)</sup>, with a median interval between the index and the secondary case of 7 weeks in one study<sup>(11)</sup>. Some of these secondary cases can be attributed to failure of chemoprophylaxis (e.g. failure of administration, poor compliance, presence of antibiotic resistance)<sup>(20,22-24)</sup>. “Late” secondary cases in close contacts may occur several months after the onset of symptoms in the index case<sup>(11,12)</sup>.

#### 4.2.2 Outbreaks

An outbreak is defined as increased transmission of *N. meningitidis* in a population, manifested by an increase in cases of the same serogroup.

Outbreaks can be subdivided into organization-based or community-based outbreaks using the criteria shown in Table 4.

**Table 4: Types of Outbreak**

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Organization-based</b> | Increased transmission of <i>N. meningitidis</i> in an organization or institution with two or more cases of the same serogroup occurring within a 4-week interval. This includes restricted populations, such as schools, day care, sports groups or social groups, as well as nursing homes or long-term care facilities.                                                                                                                         |
| <b>Community-based</b>    | Increased transmission of <i>N. meningitidis</i> in a community, with three or more confirmed cases of the same serogroup occurring within a 3-month interval AND an age-specific incidence OR specific community population incidence of approximately 10/100,000, where there is an absence of an epidemiologic link between cases. This is not an absolute threshold and should be considered in the context of other factors (see section 7.2). |

When threshold incidence rates are being calculated in order to establish whether continued transmission of *N. meningitidis* is occurring in a community, the calculation should be specific to the situation. If the cases are occurring among persons of a specific age range, the calculation should be an age-specific incidence. However, if the population is defined geographically, the calculation should use the total community population defined by that region. For the calculations, subsequent cases among close contacts should be excluded from the numerator. Age-specific incidence should be calculated for 5-year age groups (e.g. 0 to 4 year olds, 5 to 9 year olds, 10 to 14 year olds). For example, in a community with 10 cases, of which 2 live in the same household, only 9 cases are included when calculating age-specific incidence rates for the purpose of determining whether an outbreak or ongoing transmission is occurring.

#### 4.2.3. Persistently Elevated Rates

Persistently elevated rates of disease are observed when there is ongoing occurrence of cases of meningococcal disease of the same serogroup at rates above the expected level of disease in a given population. These cases can be sporadic or outbreak-related and continue to occur despite local public health control measures.

## 5.0 Diagnosis and Bacterial Typing

Laboratory confirmation of a clinical diagnosis of IMD is important for the identification and management of cases and outbreaks, as well as for regional and national surveillance and detection of

---

epidemiologic trends over time. Meningococcal isolates from all IMD cases should routinely be sent to the provincial/territorial laboratory to ensure appropriate and timely monitoring of serogroups and for antibiotic susceptibility testing. Isolates are forwarded to the Public Health Agency of Canada's National Microbiology Laboratory (NML) for further phenotypic typing and genetic analysis.

Culture of blood, cerebrospinal fluid (in the absence of contraindications to lumbar puncture) and other normally sterile sites is required for isolating bacteria for identification. Polymerase chain reaction (PCR) testing is available in several centres across Canada for rapid molecular diagnosis of meningococcal infection and serogroup identification on whole blood and cerebrospinal fluid. PCR has greater sensitivity than culture, particularly if there has been prior administration of antibiotics<sup>(8,25-27)</sup>. Latex agglutination antigen testing may be a useful adjunct.

Several laboratory methods are used to track the epidemiology of *N. meningitidis* in Canada. The serogroup, serotype and serosubtype of the organism can be determined using antibody or by DNA sequencing of the responsible genes. Antigenic variation in proteins located in the outer membrane of the organism can be detected. For example, an isolate of *N. meningitidis* C:2a:P1.2 is of serogroup C, serotype 2a and serosubtype P1.2.

In addition, genotyping procedures can be done, such as multilocus enzyme electrophoresis (MLEE), multilocus sequence typing (MLST) and pulsed field gel electrophoresis (PFGE). MLEE and MLST are most suitable for studying global molecular epidemiology. PFGE can be useful in discriminating strains of *N. meningitidis* within a population, particularly during a period of increased incidence of disease. Knowledge of PFGE patterns can be most useful for smaller populations in which the incidence of disease may be very high but there are only a few cases, and more discriminatory tests are required to determine whether these are unrelated cases caused by different strains or whether there is increased transmission of a particular strain.

## 6.0 Surveillance of Invasive Meningococcal Disease in Canada

IMD is reportable in all provinces and territories and is nationally notifiable. Each province or territory has procedures in place for the rapid notification of cases to medical officers of health and timely reporting to the appropriate provincial or territorial public health official.

Both confirmed and probable cases of IMD are notifiable at the national level. Provinces and territories report case-by-case data with basic core variables on a weekly basis to the Notifiable Diseases Reporting System. In addition, the Immunization and Respiratory Infections Division (IRID), Centre for Infectious Disease Prevention and Control, Public Health Agency of Canada, conducts enhanced surveillance for IMD. Provinces and territories report more detailed epidemiologic and laboratory data for each case to the IRID. Detailed surveillance reports are published periodically in the *CCDR*; the most recent report was published in February 2004<sup>(2)</sup>.

Most jurisdictions rely on passive surveillance for identification of cases. When an increase in the incidence of IMD is suspected in a particular region, there should be heightened surveillance for cases and the collection of more detailed epidemiologic and microbiologic information.

The following steps should be taken:

- 
- . The provincial or territorial epidemiologist or medical health officer should be consulted immediately to decide whether the increased incidence constitutes an outbreak.
  - . Active surveillance should be initiated. Epidemiologic information should be obtained on each case, with the objective of identifying high-risk groups and determining associations that will permit targeted control interventions. The data collected should include age; sex; place of residence; vaccination status, including the type of meningococcal vaccine, the number of doses and age at vaccine administration; recent travel; attendance or employment at a day care centre or school; and participation in recent athletic or recreational events and gatherings. Other information relevant to the outbreak should also be collected (e.g. social or cultural setting).
  - . Basic epidemiologic analysis should include age-group-specific attack rates (calculated for 5-year age groups), serogroup-specific rates and case fatality ratios. Techniques such as historical modeling can be used to determine whether the current incidence is greater than in previous years; this is particularly important in light of the seasonality of the disease.
  - . The province or territory should notify the IRID of the increase in IMD incidence, and the IRID will relay the information to the other provinces and territories.
  - . When an outbreak is suspected, serogroup determination becomes critical for appropriate decisions regarding control measures. Provincial and territorial public health laboratories, in collaboration with the NML, may conduct typing, subtyping and other genotyping tests (e.g. PFGE) that have proven helpful in characterizing outbreaks and determining disease trends.
  - . During outbreaks or whenever there is failure to isolate or determine the serogroup of an organism, clinical specimens should immediately be forwarded by the provincial laboratory to the NML, Public Health Agency of Canada, for molecular diagnostic testing and further strain identification.

At this time conjunctivitis and pneumonia cases due to *N. meningitidis* are not nationally notifiable and reported to the Public Health Agency of Canada. However the following definitions and suggested treatments have been made. A conjunctivitis case requires isolation of *N. meningitidis* from the eye or the conjunctival sac in association with purulent conjunctivitis. A pneumonia case is one with a Gram stain (if done) showing Gram-negative diplococci and a polymorphonuclear cell response from sputum or respiratory aspirate, isolation with heavy growth of *N. meningitidis* and clinical or radiological evidence of pneumonia. Patients with *N. meningitidis* conjunctivitis or pneumonia should be treated with appropriate systemic antibiotics<sup>(28)</sup>.

## 7.0 Management of Invasive Meningococcal Disease

The management of cases of IMD is divided into two sections, the management of sporadic cases and the management of outbreaks.

### 7.1 Management of Sporadic Cases

The public health response to a sporadic case of IMD includes management of the sporadic case, contact identification and tracing, and maintenance of surveillance for further cases.

---

### 7.1.1 Case Management

When there is a strong clinical suspicion of IMD and laboratory confirmation of the diagnosis may be delayed, a specimen from a normally sterile site should be obtained for culture (or other laboratory identification of *N. meningitidis*) if possible and empiric therapy started quickly. The case or a proxy for the case should be interviewed to determine who are the close contacts (see Table 3). In addition to therapeutic antibiotics, the case should receive chemoprophylaxis before hospital discharge unless the infection was treated with an antibiotic that is effective in nasopharyngeal eradication of *N. meningitidis*<sup>(29)</sup>. Nasopharyngeal cultures, used to demonstrate carriage of *N. meningitidis*, have no role in the identification or management of cases and contacts.

### 7.1.2 Contact Management

The cornerstone of prevention of secondary cases of IMD is aggressive contact tracing to identify people at increased risk of disease (i.e. close contacts). The management of close contacts of cases with conjunctivitis or pneumonia is the same as for close contacts of invasive disease. Chemoprophylaxis should be provided to close contacts in order to eliminate meningococci from any carrier within the network of close contacts, thereby reducing the risk to other susceptible individuals in the social network (see Section 10.0 Recommendations for Chemoprophylaxis)<sup>(30)</sup>. Nasopharyngeal carriage of meningococci is common: at any given time about 10% of the population carry meningococci. The rationale for providing chemoprophylaxis for HCWs who are close contacts (see Table 3) is different from that for other close contacts. The time of exposure can be clearly identified. Antibiotics that eliminate carriage given soon after that exposure would be expected to eliminate carriage and prevent potential development of disease in treated individuals. Currently, no studies have assessed the effectiveness of chemoprophylaxis in this situation<sup>(31)</sup>.

Close contacts of an IMD case are at increased risk of secondary disease<sup>(9-11)</sup>. They should be alerted to signs and symptoms of meningococcal disease and be advised to seek medical attention immediately should they develop febrile illness or any other clinical manifestations of IMD. Chemoprophylaxis should be offered to all persons having close contact with an IMD case during the infectious period (the 7 days before onset of symptoms in the case to 24 hours after onset of effective treatment), regardless of their immunization status (see section 10.0 Recommendations for Chemoprophylaxis). Chemoprophylaxis of close contacts should be administered as soon as possible and preferably within 24 hours of case identification but is still recommended for up to 10 days (the incubation period) after the last contact with an infectious case. Chemoprophylaxis should be considered for close contacts of a case that is strongly suspected to be IMD, even if laboratory confirmation cannot be obtained within 24 hours.

The vaccination status of close contacts, including the type of meningococcal vaccine, the number of doses and age at vaccine administration, should be determined. Vaccination of susceptible close contacts, in addition to chemoprophylaxis, should be considered when the serogroup is vaccine preventable, as it may further reduce the risk of subsequent meningococcal disease; vaccination should be carried out as soon as possible (see section 11: Indications For and Use of Meningococcal Vaccines). The increased risk of disease for household contacts persists for up to 1 year after disease in the index case and beyond any protection from antibiotic chemoprophylaxis<sup>(10,11,20,21)</sup>.

In the United Kingdom (UK) it is recommended that close contacts of cases with vaccine-preventable strains of *N. meningitidis* who received chemoprophylaxis should be offered an appropriate vaccine<sup>(32)</sup>. However, in the UK a different definition of “close contacts” is used than in Canada. The National

---

Advisory Committee on Immunization (NACI) recommends that vaccination of unimmunized household and intimate social contacts may further reduce the risk of secondary cases beyond the benefit of chemoprophylaxis<sup>(33)</sup>.

---

### 7.1.3 *Cadavers and Infectious Risk*

While cadavers with meningococcal disease have traditionally been considered a possible source of infection risk, if the deceased person had been treated with an effective antibiotic for at least 24 hours before death, any risk is likely to be very low. If the deceased had not been treated with an effective antibiotic before death, then it is prudent for those who have occupational contact with a cadaver to follow routine infection control practices with additional droplet and contact precautions<sup>(30,34,35)</sup>.

In general, when caring for the deceased, attention to routine infection prevention and control practices is sufficient, specifically, adherence to the routine infection control practices for hand washing/hand hygiene, mask/eye protection/face shields, glove and gown use. In addition, individuals who die in a home setting should be wrapped in a sheet (ideally using a plastic bag to protect the mattress and contain body fluids) and preferably kept in a cool, dry location until collected by funeral services<sup>(35)</sup>.

### 7.1.4 *Invasive Meningococcal Disease in Travellers*

When an IMD case has been identified in a traveller who was within the infectious period during the journey, a decision on the need for contact tracing and chemoprophylaxis should be based on the mode of transportation, the length of time fellow travellers could have been exposed to the case and the type of exposure. Any decision should be made in collaboration with the provincial or territorial epidemiologist or medical health officer.

To date, there have been no published cases of IMD resulting from transmission aboard aircraft. However, there have been reports of transmission of tuberculosis during air travel<sup>(36,37)</sup>. Current surveillance systems may not detect secondary cases resulting specifically from air travel. Therefore the theoretical risk of transmission during air travel should be considered. Contact tracing of specified passengers is advised by the Centers for Disease Control and Prevention in the United States and by the Communicable Diseases Network Australia<sup>(30,36)</sup>. However, prophylaxis of persons travelling in the next seat on the same plane is not advised in the United Kingdom, unless the individual is already identified as a close contact<sup>(32)</sup>.

On the basis of expert opinion and the extrapolation of data on secondary transmission of tuberculosis cases aboard aircrafts, it is recommended that contact tracing be initiated if

- . the case travelled during the infectious period (7 days before onset of symptoms to 24 hours after the onset of effective treatment)
- . the flight occurred within the previous 10 days (i.e. still eligible for prophylaxis)

#### **AND**

- . the total time spent aboard the aircraft was at least 8 hours, including ground time on the tarmac.

It is important to note that aircraft passenger manifests are rarely kept after 48 hours, and contact tracing may be more difficult after that time.

---

An attempt should be made to trace, contact and offer antimicrobial chemoprophylaxis and vaccination, if appropriate, to the following:

- persons travelling with the index case who have had prolonged close contact (e.g. room-mates);
- passengers who were sitting immediately on either side of the index case (but not across the aisle);
- passengers or flight staff who have had direct contact with the respiratory secretions of the index case.

These individuals may be at increased risk, as bacteria transmitted through respiratory droplets can be propelled short distances (< 1 m) during coughing and sneezing<sup>(35)</sup>.

## 7.2 Detection and Management of Outbreaks

Outbreaks can be broadly classified as organization-based or community-based (see Table 4). Regardless of the type of outbreak, contact tracing, identification of close contacts and provision of chemoprophylaxis to close contacts need to be conducted as described for sporadic cases (see section 7.1). There is no evidence to support the provision of widespread chemoprophylaxis for persons who are not close contacts. Widespread use may result in eradication of benign strains of *Neisseria* that provide protective antibodies, the generation of drug-resistant strains and an increase in the prevalence of drug-related adverse events<sup>(38)</sup>.

Outbreak detection and management require complex decision-making that takes into account a variety of factors. When evidence suggests that an outbreak is occurring with increased transmission of *N. meningitidis* involving a vaccine-preventable serogroup in a delineated population, vaccination of persons at high risk should be considered. The type of association between cases helps to define the group at risk. Decisions regarding the use of vaccine in communities with a higher than expected rate of disease should be made in consultation with the provincial or territorial epidemiologist or medical health officer.

The following considerations can be useful in determining whether there is increased transmission of *N. meningitidis* within a defined population:

- An increased rate of disease, as outlined in Table 4.
- In smaller populations, the clustering of disease in an age group. In large populations, one may see a shift in age distribution during an outbreak.
- The same serogroup occurring in the cases. For IMD caused by serogroup B and C, the likelihood that two strains are related increases as one goes from common serogroup, to common serotype to common electrophoretic type. A discussion with a medical microbiologist or laboratory expert is required to ascertain the degree of relatedness.

The criteria for vaccination should be sufficiently broad to control the outbreak. Ongoing surveillance to assess the effectiveness of outbreak control is essential and may result in changes to the target group for which vaccination is recommended.

The presence of a particular vaccine-preventable serogroup is the most important laboratory characterization in evaluating the need for immunoprophylaxis (i.e. serogroup C, W135, Y or A). The following additional factors should be taken into account when considering a vaccination campaign:

- 
- . The population at risk of the disease must be clearly defined. Identification of target groups and boundaries for vaccination programs (e.g. age, place of residence or activity) may be determined on the basis of the characteristics of the community and the epidemiologic features of the cases.
  - . The risk of disease must be sufficiently high to justify implementing a vaccination campaign (statistical modeling techniques may be helpful).
  - . The most appropriate available vaccine should be used for the population at risk (refer to section 11.0).
  - . Mechanisms for sufficient vaccine acquisition and delivery must be in place.
  - . For optimal outbreak control, vaccine program planning should aim to achieve high coverage rates in target groups<sup>(39)</sup>.
  - . Environmental factors that might increase a population's susceptibility (e.g. influenza epidemic) should be considered.

### **7.3 Management of a Persistently Elevated Rate of Meningococcal Disease**

Effective local management of cases and identified outbreaks remains the cornerstone of prevention and control of IMD. Consideration of a systematic regional or provincial/territorial vaccination strategy may be needed if there are unacceptably high projected rates of disease and mortality despite ongoing regional outbreak interventions.

Outbreak management is usually carried out as an emergency measure and results in disruption of routines, a higher cost of vaccine delivery, overuse of chemoprophylaxis and the sudden demand for large quantities of vaccine. If a large proportion of the population is vaccinated because of the occurrence of multiple localized outbreaks and disease is still occurring, the decision to extend vaccination to the remainder of the population at risk may be considered.

Although general recommendations for systematic regional and provincial/territorial vaccination cannot be made, consideration may be given to this strategy in the circumstances outlined above. All levels of public health jurisdictions should ensure that they have specific contingency plans for mass vaccination. A decision of this nature must take into account public concern and political realities but cannot be based solely on these factors.

The effectiveness of outbreak control measures should be evaluated in order to ascertain whether continued occurrence of cases after a mass vaccination campaign is due to vaccine failure, poor immunization coverage, inadequate definition of the target population or other reasons.

---

## **8.0 Communication Strategies**

### **8.1 Communication Pertaining to Sporadic Cases**

There is usually no need to inform the general public of a sporadic case, even if it involves a fatality. However, it is important that a communication strategy be prepared in advance in order to address any questions that may arise among those concerned with the control measures. Details of the communication strategy need to be tailored to the context of the sporadic case (e.g. liaison with school authorities is important when a case is a student).

### **8.2 Communication Pertaining to Outbreaks**

It is essential that a communication strategy be in place to provide timely information to the public when an outbreak occurs. A communication strategy aimed at the health care community should also be developed. This should include the criteria and the process for reporting to public health, timely surveillance reports and updates, guidelines on early diagnosis (including signs and symptoms), and recommended treatment and prophylactic measures. It is important to involve the health care community as early as possible after the recognition of an outbreak. An outbreak advisory committee comprising public health representatives, clinicians and medical laboratory personnel should be established. It is particularly important that the adjacent local, provincial and/or territorial jurisdictions be informed about the outbreak and related control strategies. The IRID of the Public Health Agency of Canada should be informed of all outbreaks and is responsible for informing other Canadian and international public health authorities.

### **8.3 Communication Pertaining to Persistently Elevated Rates**

It is essential that a communication strategy be prepared before a decision is made to undertake a program of systematic vaccination. This should be designed and managed with input from a communications expert. In addition to the principles previously described, essential elements of a communication strategy include the following:

- . Wide consultation with public health representatives, clinicians and laboratory personnel before any decision is made.
- . Clearly designated responsibilities. Public health authorities should be responsible for the announcement of the decision and the management of communications with respect to the operation of a control program.
- . Within each organization, one spokesperson should be responsible for communicating with the media.

---

## 9.0 Recommendations for Travellers

### 9.1 Travellers to Destinations Within Canada

Under most circumstances, Canadians travelling within Canada do not need to take special precautions to protect themselves from meningococcal disease. The risk of acquiring IMD as a traveller in North America is low, even in areas with higher than usual rates of disease. Therefore, preventive measures, including the use of vaccine, are not warranted.

Special circumstances under which a Canadian travelling within Canada should consider vaccination include the following:

- the individual is travelling to an area where there is an outbreak for which an immunization program is in progress AND
- the individual travelling is of an age that falls within the population targeted for immunization by the local health authorities AND
- the individual's duration of stay in the outbreak area is for an extended period of time (e.g. attendance for a school term).

These persons are more likely to interact with the population at increased risk of transmission (the population targeted for immunization). The decision to recommend vaccination for travellers within Canada who meet these criteria should be based on individual risk assessment. The nature of the travel and the type of contact with the population at risk are important factors to consider (e.g. a child staying in a hotel has a different risk from a teenager attending parties). The traveller should be appropriately counselled on the risk-benefit in order to make an informed decision. In most circumstances, immunization upon arrival at the outbreak or hyperendemic area is sufficient, but consideration could be given to immunization before arrival.

### 9.2 Students Attending Colleges in the United States

The Advisory Committee on Immunization Practices in the United States (US) has recommended that all US college students should be informed of the risk of meningococcal disease and the availability of a vaccine, so that they are able to make informed individual decisions regarding vaccination against serogroup C meningococcal disease<sup>(40)</sup>. These recommendations were made in light of outbreaks that have occurred in US colleges. No such outbreaks have occurred in Canada. Canadian students who will be attending college in the US should inform themselves of the policies of the institution that they will be attending, as they may be required to provide proof of serogroup C immunization before starting their studies. NACI recommends that all Canadian adolescents and young adults be immunized with meningococcal C conjugate vaccine<sup>(33)</sup>. As students attending colleges and universities are included in this recommendation by virtue of their age, there is no need to make special recommendations for this group of people.

---

### 9.3 Travellers to International Destinations

International travellers should be aware of the risk of IMD at their destination of choice. IMD occurs sporadically worldwide and in focal epidemics. The traditional endemic or hyperendemic areas of the world (the “meningitis belt”) include the savannah areas of sub-Saharan Africa extending from Gambia and Senegal in the west to Ethiopia and Western Eritrea in the east. Health care professionals advising Canadian travellers should remain current with global meningococcal activity. Current meningococcal outbreak information can be obtained through the Public Health Agency of Canada, Travel Medicine Program (<[www.travelhealth.gc.ca](http://www.travelhealth.gc.ca)>) and the World Health Organization (WHO) (<[http://www.who.int/csr/don/archive/disease/meningococcal\\_disease/en/](http://www.who.int/csr/don/archive/disease/meningococcal_disease/en/)>).

Quadrivalent meningococcal vaccine is recommended for Canadian international travellers requiring meningococcal vaccine. Meningococcal C conjugate vaccine alone is not appropriate for protection of travellers, as it does not protect against serogroups A or W135, which are endemic in selected regions of the world. The Committee to Advise on Tropical Medicine and Travel (CATMAT) provides guidelines for health care providers counselling Canadian international travellers on meningitis vaccination. For complete information on CATMAT’s Statement on Meningococcal Vaccination for Travellers visit <[www.catmat.gc.ca](http://www.catmat.gc.ca)>.

### 9.4 International Travellers Arriving in Canada

Under the authority of the *Quarantine Act*, international travellers arriving in Canada who are ill and assessed as possibly having IMD will be referred for medical examination at local health facilities. Information about these travellers will be transferred to appropriate public health authorities.

## 10.0 Recommendations for Chemoprophylaxis

The purpose of chemoprophylaxis is to eradicate nasopharyngeal colonization by *N. meningitidis* and thus prevent disease in contacts and transmission to susceptible persons<sup>(30,31,41)</sup>. In addition, levels of chemotherapeutic agents in nasal secretions may prevent acquisition of the organism for a few days<sup>(31)</sup>. Chemoprophylaxis is not effective in preventing disease once invasion of tissue has taken place. Internationally, there are no uniform recommendations regarding chemoprophylaxis. Most jurisdictions recommend chemoprophylaxis for household contacts, but jurisdictions vary with respect to their recommendations for other types of close contacts and for the index case<sup>(29)</sup>. A recent systematic review of evidence for control policies for IMD determined that the evidence supports the use of chemoprophylaxis for household contacts and for index cases. However, there were insufficient studies to examine evidence for chemoprophylaxis in child care settings<sup>(29)</sup>. Further studies are needed.

On the basis of the available evidence and expert opinion, it is recommended that cases and all close contacts (Table 3) should receive chemoprophylaxis. The index case should receive antibiotics that eradicate nasopharyngeal carriage before discharge from hospital, unless treated with an agent that also effects nasopharyngeal eradication of *N. meningitidis* (e.g. ceftriaxone), as therapy alone may not eliminate carriage of the organism<sup>(29,42)</sup>.

Chemoprophylaxis is not routinely recommended for health care contacts, including emergency personnel. Only those health care workers who have had intensive unprotected contact (i.e. without wearing a mask) with infected patients (e.g. intubating, resuscitating or closely examining the oropharynx) require prophylaxis.

Chemoprophylaxis is unlikely to be of benefit if given > 10 days after the most recent exposure to an infectious case. Chemoprophylactic agents should be administered only to close contacts whose most recent exposure to the case was within the period of communicability (see section 7.1). Provincial and territorial public health authorities should ensure that chemoprophylaxis is available free of charge to all close contacts, as defined in Table 3. Its distribution should be facilitated through local public health authorities or, with their agreement, obtained through hospital pharmacies.

The chemoprophylactic agents recommended for the eradication of nasopharyngeal colonization by *N. meningitidis* are rifampin, ciprofloxacin and ceftriaxone (Table 5)<sup>(41,43)</sup>. It is important to ensure that contacts requiring chemoprophylaxis complete the recommended course. Ciprofloxacin can be given in a single oral dose and is an alternative in adults, but it is contraindicated in pregnancy and is not recommended for prepubertal children. Ceftriaxone is the recommended chemoprophylactic agent for pregnant women. A case-control study among young adults in Cairo, Egypt, showed that a single dose of azithromycin (500 mg, given orally) was effective and was comparable to rifampin (600 mg twice a day for 2 days, given orally) in the short-term eradication of *N. meningitidis* from the nasopharynx of carriers. In addition there has been a report of the successful control of an outbreak of serogroup B meningococcal disease among pre-school children using azithromycin after failure of rifampin chemoprophylaxis<sup>(44,45)</sup>. At this time, there is no specific recommendation to use azithromycin routinely for chemoprophylaxis in Canada, but further studies are warranted.

**Table 5: Chemoprophylaxis for Close Contacts of IMD Cases**

| Drug                 | Dosage                                                                                                                                                                                                                        | Comments                                                                                                                                                                                                                                           |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ciprofloxacin</b> | <b>Adults <sup>3</sup> 18 years of age:</b><br>500 mg x 1 dose PO                                                                                                                                                             | Contraindicated during pregnancy and lactation. Only approved for persons > 18 years of age. Not recommended for prepubertal children.                                                                                                             |
| <b>Rifampin</b>      | <b>Adults:</b><br>600 mg PO q12h x 4 doses<br><b>Children <sup>3</sup> 1 month of age:</b><br>10mg/kg (maximum 600 mg) per dose PO q12h x 4 doses<br><b>Infants &lt; 1 month of age:</b><br>5mg/kg per dose PO q12h x 4 doses | Contraindicated in pregnancy.<br>Urine and tears may be stained red. Advise against wear of soft contact lenses as they can also be stained.<br>Can reduce effectiveness of oral contraceptives. Advise use of alternative contraceptive measures. |
| <b>Ceftriaxone</b>   | <b>Adults:</b><br>250 mg IM x 1 dose<br><b>Children &lt;12 years:</b><br>125 mg IM x 1 dose                                                                                                                                   | Recommended drug for pregnant women. Alternative for persons who cannot tolerate oral medication.<br>Dilute in 1% lidocaine to reduce pain at injection site.                                                                                      |

---

## 11.0 Indications For and Use of Meningococcal Vaccines

NACI publishes detailed recommendations pertaining to the use of meningococcal vaccines. Readers are referred to these recommendations for more detailed information<sup>(33,46)</sup>. Recommendations are also contained within the most recent edition of the *Canadian Immunization Guide*<sup>(47)</sup>. Recommendations are updated as new information becomes available.

Briefly, there are two different types of meningococcal vaccine currently available in Canada: purified capsular polysaccharide vaccines and protein-polysaccharide conjugate vaccines. Polysaccharide vaccines include bivalent vaccine against serogroups A and C (MenAC-Ps) and quadrivalent vaccine for serogroups A, C, Y and W135 (MenACYW-Ps). Three monovalent meningococcal C conjugate vaccines (MenC-conjugate) are currently available: Menjugate<sup>TM</sup> (Chiron Corporation), Neis Vac-C<sup>TM</sup> (ID Biomedical Corporation) and Meningitec<sup>TM</sup> (Wyeth Pharmaceuticals).

Meningococcal C conjugate vaccines are safe, immunogenic and effective, and can be given to children < 2 years of age. The conjugate vaccine is also expected to confer longer duration of immunity compared with the polysaccharide vaccine. In addition to outbreak control, the Public Health Agency of Canada and NACI recommend routine childhood immunization with meningococcal C conjugate vaccine<sup>(33,47)</sup>.

Polysaccharide vaccines cover three additional serogroups compared with conjugate meningococcal C vaccines (i.e. serogroups A, Y, W135), but they are not immunogenic for children < 2 years of age and have a shorter duration of protection. Polysaccharide vaccines are recommended for outbreak control, for the protection of persons travelling to locations with epidemic disease attributable to vaccine serogroups and for persons who may be at increased risk of meningococcal disease. Polysaccharide vaccines are not recommended for routine childhood immunization<sup>(33)</sup>.

### 11.1 Close Contacts

Bivalent (A, C) or quadrivalent (A, C, Y, W135) polysaccharide vaccine should be considered for eligible susceptible close contacts of cases with IMD known to be caused by serogroup A; quadrivalent polysaccharide vaccine should be considered for eligible susceptible close contacts of cases of serogroup Y or W135 disease (see section 11.3 for information on revaccination). For susceptible close contacts of known serogroup C disease, meningococcal C conjugate vaccine is preferred because of longer duration of protection and induction of immunologic memory. However, polysaccharide vaccines will provide protection in older children and adults during the 1-year period of increased risk. Polysaccharide vaccines are ineffective against serogroup C disease in children < 2 years of age, and meningococcal C conjugate vaccine should be given to children in that age group. No vaccine is currently available in Canada for contacts of individuals with serogroup B disease.

Vaccination is not generally indicated for contacts of cases of disease in which the serogroup has not been determined. With the increasing use of PCR techniques the sensitivity of diagnosis will improve; serogroup identification should be obtained before immunoprophylaxis where possible. Factors that may assist in decisions regarding whether “empiric” immunization of contacts should be provided include the availability of diagnostic tests, the epidemiologic situation (e.g. there is an outbreak of serogroup Y in the community and the index case is in the at-risk group), and the age and clinical presentation of the case. If a contact has received meningococcal vaccine in the past, decisions regarding revaccination should follow current NACI guidelines (see section 11.3).

---

## 11.2 Outbreaks

Outbreaks of serogroup C meningococcal disease in teenagers and adults may be controlled by use of meningococcal C conjugate or polysaccharide vaccines; however, the use of conjugate vaccine may be preferable because of the induction of immunologic memory and prolonged duration of protection<sup>(33)</sup>. In adults and children previously immunized with a polysaccharide vaccine, antibody response has been found to be lower after a second than after the first dose when the time interval between the two doses is less than the recommended 5 years. This response has been termed “immunologic hyporesponsiveness”<sup>(48-50)</sup> and has not been observed with conjugate vaccine<sup>(48)</sup>. Adults who have been vaccinated with a second dose of polysaccharide vaccine after the recommended interval have demonstrated an adequate response. The clinical significance of immunologic hyporesponsiveness is unknown, but if revaccination is considered in persons who received polysaccharide vaccine in the past, the use of meningococcal C conjugate vaccine is recommended. In younger children (< 10 years of age) meningococcal C conjugate vaccine is preferred for control of outbreaks in view of superior immunogenicity and efficacy in this age group. Children < 2 years of age should not receive the polysaccharide vaccine for prophylaxis but should complete a full course of conjugate vaccine appropriate to their age, according to the NACI recommended schedule<sup>(33)</sup>.

Outbreaks of meningococcal A disease have not occurred in Canada since the 1940s. If this rare event occurs, polysaccharide vaccine is recommended. Readers are referred to the most recent NACI meningococcal vaccine recommendations for further information<sup>(33,46,47)</sup>. For the control of outbreaks associated with serogroup Y or W135 meningococci, one dose of a quadrivalent polysaccharide vaccine is recommended for persons ≥ 2 years of age.

## 11.3 Revaccination

The need for and effectiveness of revaccination with polysaccharide vaccine has not been fully established. For persons fully immunized with meningococcal C conjugate vaccine, revaccination is not thought to be necessary at this time, although there are insufficient data to predict persistence of immunologic memory (and presumed protection) beyond 5 years. This recommendation may be revised in the future; further research is warranted. Readers are referred to the most recent NACI meningococcal vaccine recommendations for further information<sup>(33,46,47)</sup>.

## 9.4.1 Invasive Pneumococcal Disease (IPD)

### Special Precautions/Considerations

Precautions: Droplet

#### Reporting

Notifiable: Yes

Reporting: Routine (within 7 days)

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Infectious Agent</b>      | <i>Streptococcus pneumoniae</i> ( <i>S. pneumoniae</i> ), also known as pneumococcus, is a Gram-positive encapsulated coccus, of which 90 serotypes are known to cause disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Clinical Presentation</b> | <p>In children, Invasive Pneumococcal Disease (IPD) usually occurs as bacteremia without a clinical focus, pneumonia and meningitis. In adults, IPD most commonly presents as bacteremia, pneumonia, meningitis and other clinical manifestations such as endocarditis or septic arthritis.</p> <p>Symptoms of pneumonia in infants and young children may not be specific and may include fever, cough, rapid breathing and grunting. In adults, symptoms may include sudden onset with fever, pleural pain, difficulty or rapid breathing, productive cough or rusty sputum.</p> <p>Meningitis due to IPD in persons over 2 years of age presents with fever, stiff neck and headache, which can develop over several hours or 1 to 2 days. Other symptoms can include nausea, vomiting, photophobia, confusion and lethargy. In children under 2 years of age, the above symptoms may be absent, but they may present with irritability, poor feeding, vomiting, lethargy, and high-pitched cry.</p> <p>Otitis media, sinusitis and bronchitis are non-invasive and less severe manifestations of pneumococcal infection but are considerably more common.<br/> <b>Only invasive disease is reportable.</b></p> <p><i>S. pneumoniae</i> may also colonize the lining of the nose or throat of individuals (carriers) without symptoms and may be passed from person to person.</p> |
| <b>Diagnostics</b>           | <p>Laboratory criteria for diagnosis of IPD require the isolation of <i>S. pneumoniae</i> by culture from a normally sterile site (e.g. blood or cerebrospinal fluid or, less commonly, joint, pleural or pericardial fluid).</p> <p>Follow your regional laboratory procedures for serologic testing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Treatment</b>             | Antibiotic resistant pneumococci strains have become more common, therefore identification of the strain is important. Individuals suspected of having IPD should be treated promptly, empiric antimicrobial therapy may be required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Occurrence</b>            | <p><b>Worldwide:</b> Most <i>S. pneumoniae</i> serotypes have been shown to cause serious disease, but only a few serotypes produce the majority of pneumococcal infections. The 10 most common serotypes account for approximately two-thirds of invasive disease worldwide. Over 90% of all pneumococcal infections are caused by 23 strains. Pneumococcal infections are most common during the winter and spring months.</p> <p><b>Canada:</b> The overall incidence of IPD is not known; it is estimated that there are approximately 500,000 cases of pneumococcal disease each year. <i>S. pneumoniae</i> is the leading cause of invasive bacterial infections in children including bacteremia, septicemia, pneumonia, and meningitis. Children less than</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                                      | <p>five years, especially those less than two years, and the elderly have the highest incidence. Aboriginal children living in northern Canada have a three times higher incidence rate than non-Aboriginals.</p> <p><b>Nunavut:</b> From 1999–2011 there have been 99 reported cases, with an annual average rate of 26.0 cases per 100,000. Approximately 70% of cases were male, with the majority of reported cases in Baffin Region.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Reservoir</b>                     | Humans. Pneumococci are commonly found in the upper respiratory tract of healthy people.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Transmission</b>                  | By droplet spread or direct oral contact, or indirectly via articles contaminated with respiratory secretions. Person-to-person transmission is common, but illness among casual contacts is infrequent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Incubation Period</b>             | May be as short as 1 to 3 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Communicability</b>               | Presumably until discharges from nose and mouth no longer contain virulent pneumococci in significant numbers. Appropriate antibiotic treatment will end communicability within 24 to 48 hours.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Susceptibility and Resistance</b> | <p>Any process that affects the anatomic or physiologic integrity of the lower respiratory tract (e.g. influenza, pulmonary edema, chronic lung disease, etc.) increases the individual's susceptibility to symptomatic pneumococcal infection. Individuals most susceptible to serious and invasive pneumococcal infections are typically those with chronic medical conditions including:</p> <ul style="list-style-type: none"> <li>• Chronic cerebral spinal fluid (CSF) leak;</li> <li>• Chronic neurologic condition that may impair clearance of oral secretions;</li> <li>• Cochlear implants (including those children who are to receive implants);</li> <li>• Chronic cardiac or pulmonary disease;</li> <li>• Diabetes mellitus;</li> <li>• Asplenia (functional or anatomic);</li> <li>• Sickle cell disease or other hemoglobinopathies;</li> <li>• Congenital immunodeficiencies involving any part of the immune system, including B-lymphocyte (humoral) immunity, T-lymphocyte (cell) mediated immunity, complement system (properdin, or factor D deficiencies), or phagocytic functions;</li> <li>• Hematopoietic stem cell transplant (recipient);</li> <li>• HIV infection;</li> <li>• Immunosuppressive therapy including use of long term corticosteroids, chemotherapy, radiation therapy, post-organ transplant therapy, and certain anti-rheumatic drugs;</li> <li>• Chronic kidney disease, including nephrotic syndrome;</li> <li>• Chronic liver disease (including hepatic cirrhosis due to any cause);</li> <li>• Malignant neoplasms including leukemia and lymphoma;</li> <li>• Solid organ or islet transplant (candidate or recipient).</li> </ul> <p>There is also an increased risk of invasive disease when adults are in contact with young children as children are more likely to be colonized.</p> <p>Infection generally confers immunity to the specific serotype. This immunity may last for years.</p> |

## 9.5.1 Legionellosis

### Special Precautions/Considerations

Precautions: Routine

#### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Infectious Agent</b>      | <i>Legionella</i> are gram-negative bacilli. The bacteria survive for months in tap or distilled water but are susceptible to many disinfectants, moist heat, and dry heat. There are at least 35 species of <i>Legionella</i> , but <i>Legionella pneumophila</i> ( <i>L. pneumophila</i> ) serogroups 1, 4, and 6 are responsible for more than 90% of clinical disease in humans.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Clinical Presentation</b> | <p>There are two distinct clinical and epidemiological manifestations of Legionellosis: Legionnaire's Disease and Pontiac Fever.</p> <p>The early symptoms of both diseases include anorexia, malaise, myalgia, headache and rapidly rising fever with chills (temperatures commonly reach 39°C to 40.5°C). Non-productive cough, abdominal pain and diarrhea are common.</p> <p>For Legionnaire's Disease, chest x-rays often show pneumonia that may progress to bilateral involvement and ultimately respiratory failure. Case fatality rates for Legionnaire's Disease have reached as high as 15%.</p> <p>Pontiac fever is a milder illness, which is not associated with pneumonia or death. Clients with Pontiac fever usually recover spontaneously in 2–5 days.</p> |
| <b>Diagnostics</b>           | <p>The diagnosis of Legionellosis can be made by isolation of the organism from respiratory secretions or from a normally sterile site, seroconversion, a fourfold increase in antibody levels (<math>\geq 1:128</math>), or positive urinary antigen (for <i>L. pneumophila</i>). Urinary antigen testing is the most rapid and sensitive test but only detects infection with <i>L. pneumophila</i>. Samples may not show test positivity for up to five days after the start of symptoms. Testing may need to be repeated if the specimen is taken early in the illness. Serology testing to demonstrate recent infection requires two samples taken 3–6 weeks apart to show a fourfold rise in titre.</p> <p>Follow your regional laboratory procedures for testing.</p> |
| <b>Treatment</b>             | <p>Legionnaire's Disease is treatable with antibiotics.</p> <p>Consult a physician regarding treatment recommendations.</p> <p>Cases with Pontiac fever generally recover spontaneously in 2–5 days without treatment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Occurrence</b>            | <p><b>Worldwide:</b> The earliest documented case of Legionellosis occurred in 1947 and the first documented outbreak in Minnesota in 1957. The <i>Legionella</i> bacterium was first identified in 1976 when 34 members of the American Legion died following a conference in Philadelphia. Cases have been reported in Canada, the US, Europe, Australia, Africa and South America. Most cases are sporadic, however, when outbreaks occur it is most often with low attack rates (0.1–5%) in the population at risk. Legionellosis, where prevalent, causes 2–15% of all community-acquired pneumonia. The case fatality rate ranges from 3–5%.</p>                                                                                                                       |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                                      | <p><b>Canada:</b> Cases have been reported in Canada since 1986. In general, the majority of reported cases of Legionnaires' Disease are sporadic. The reported rate from 1989 to 1999 has been approximately 0.34 cases per 100,000. In 2005, an outbreak of Legionnaire's Disease in a Toronto nursing home was responsible for 20 deaths among 127 infected residents and workers.</p> <p><b>Nunavut:</b> There have been no reported cases in Nunavut.</p>                                                                                                                                                                                                                                                                                                                       |
| <b>Reservoir</b>                     | The organism is ubiquitous in nature, particularly in aquatic environments. Outbreaks and sporadic cases have been linked to air conditioning cooling towers, evaporative condensers, humidifiers (including household humidifiers), whirlpool spas, respiratory therapy devices, decorative fountains and potable water systems.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Transmission</b>                  | <i>Legionella</i> are opportunistic pathogens with widespread distribution in the environment but cause a very low rate of infection in the general population. It is most commonly associated with water-droplet transmission from cooling towers. <i>Legionella</i> are transmitted directly from the environment to humans with the most common source thought to be aerosolization of water containing <i>L. pneumophila</i> . The organism can survive for years in water at 2-8°C and is resistant to usual levels of chlorination.                                                                                                                                                                                                                                            |
| <b>Incubation Period</b>             | The incubation period for Legionnaire's Disease is 2–10 days, most often 5–6 days. Pontiac fever has a much shorter incubation period with a range of 5–66 hours, most often 24–48 hours.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Communicability</b>               | Person-to-person transmission has not been documented.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Susceptibility and Resistance</b> | Illness occurs most frequently with increasing age. Persons who smoke, have diabetes, lung or renal disease are at highest risk. The disease is rare in persons under 20 years of age. Outbreaks have occurred among institutionalized patients/residents.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Case</b>                          | <p>Confirm the diagnosis – ensure that all suspect cases receive prompt investigative procedures to confirm the case. Contact and interview the case, parent or guardian. Complete the <a href="#">Communicable Disease Report Form</a> dated September 2013 or later (section 9.5.2).</p> <p>Ensure the case is asked about the following exposures:</p> <ul style="list-style-type: none"> <li>• History of travel, including dates and location(s).</li> <li>• History of exposure to air conditioners, humidifiers, water fountains or spas and other high risk areas during the 10 days prior to illness.</li> <li>• Any risk factors such as smoking or medical conditions.</li> <li>• Occupation.</li> <li>• Residency or attendance at a facility or institution.</li> </ul> |
| <b>Contacts</b>                      | No follow-up is required; person-to-person transmission of Legionellosis has not been documented.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Outbreaks</b>                     | Contact your Regional Communicable Disease Coordinator (RCDC) if even a single case is reported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Health Education</b>              | Avoid exposure to aerosolized contaminated water.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Infectious Agent</b>              | <i>Mycobacterium leprae</i> ( <i>M. leprae</i> ) is the bacterium which causes leprosy. It is an obligate intracellular, acid-fast bacillus that can be Gram-stain variable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Clinical</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Clinical Presentation</b>         | <p>A chronic bacterial disease characterized by the involvement primarily of skin as well as peripheral nerves and the mucosa of the upper airway. Clinical forms of the disease represent a spectrum reflecting the cellular immune response to <i>M. leprae</i>. The following characteristics are typical of the major forms:</p> <ol style="list-style-type: none"> <li>(1) <b>Tuberculoid</b>: one or a few well-demarcated, hypopigmented and anesthetic skin lesions, frequently with active spreading edges and a clearing centre; peripheral nerve swelling or thickening also may occur.</li> <li>(2) <b>Lepromatous</b>: a number of erythematous papules and nodules or an infiltration of the face, hands and feet with lesions in a bilateral and symmetrical distribution that progress to thickening of the skin.</li> <li>(3) <b>Borderline (dimorphous)</b>: skin lesions characteristic of both the tuberculoid and lepromatous forms.</li> <li>(4) <b>Indeterminate</b>: early lesions, usually hypopigmented macules, without developed tuberculoid or lepromatous features.</li> </ol> |
| <b>Diagnostics</b>                   | Consult your local laboratory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Treatment</b>                     | Consult with physician.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Occurrence</b>                    | <p><b>Worldwide</b>: More common in tropical and subtropical areas. India, Indonesia, and Burma account for 70% of all cases in the world. It is estimated that there are 1-2 million people worldwide who have leprosy.</p> <p><b>Canada</b>: Rare.</p> <p><b>Nunavut</b>: No reported cases.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Reservoir</b>                     | Humans are thought to be the only reservoir of proven significance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Transmission</b>                  | The mode of transmission remains unclear but it is not highly communicable. Likely transmitted from nasal mucosa of an infected person to the skin and respiratory tract of another person via droplets, from the nose and mouth, during close and frequent contact with untreated cases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Incubation Period</b>             | 9 months to 20 years with the average incubation period approximately 4 years for tuberculoid leprosy and 8 years for lepromatous leprosy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Communicability</b>               | Clinical and laboratory evidence suggest that infectiousness is lost in most instances within a day of treatment with multidrug therapy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Susceptibility and Resistance</b> | Infection among close contacts of cases is frequent, however clinical disease occurs only in a small proportion of those infected. The form of leprosy depends on the ability to develop cell-mediated immunity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Infectious Agent</b>      | Respiratory syncytial virus (RSV) is an enveloped, non-segmented RNA virus. The two major strains of RSV (groups A and B), each of which have numerous identified genotypes, often circulate concurrently.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Clinical Presentation</b> | <p>While RSV can cause acute illness at any age, in infants and young children it is a major cause of bronchiolitis and pneumonia.</p> <ul style="list-style-type: none"> <li>• Most RSV begins with nasal congestion, upper respiratory tract infection and may include a low-grade fever. Classic presentation is bronchiolitis with diffuse wheezing, cough, difficulty breathing, lung hyperinflation and trouble feeding.</li> <li>• For newborns and preterm infants respiratory signs can begin with periods of apnea over a few days, especially under 6 months of age.</li> <li>• For older children and adults illness generally manifests as upper respiratory illness and exacerbation of underlying lung conditions.</li> </ul>                                                                                                                                                                                                                                                |
| <b>Diagnostics</b>           | <p>The specimen of choice is the nasopharyngeal (NP) swab (See 9.7.3 for NP swab procedure).</p> <p>When RSV is first suspected in the community, take a NP swab for up to 5 patients in a variety of age groups over a few days.</p> <p>(Note that the use of point of care rapid tests is restricted to admitted patients for infection control purposes.)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Treatment</b>             | As per physician direction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Occurrence</b>            | <p><b>Worldwide:</b> RSV is the most common cause of bronchiolitis and pneumonia in children under 1 year worldwide. In the northern hemisphere, epidemics peak February to March and can last up to 5 months, however timing varies by location and year.</p> <p><b>Canada:</b> 10% of respiratory-related hospital admissions in children can be attributed to RSV infection, the highest rate is in infants under 6 months. RSV is not a nationally notifiable disease thus complete national data is not available. Based on the laboratory network data available RSV activity generally starts in late fall, peaking in early winter and tapering into late spring.</p> <p><b>Nunavut:</b> There are sporadic cases throughout the year with activity peaking January to the end of May, from 2008-2012 there were between 93-168 reported cases per year. There is no consistent regional trend from 2008-2012 except activity generally appears to begin in Qikiqtaaluk region.</p> |
| <b>Reservoir</b>             | Humans                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Transmission</b>          | <p>Contact with infected droplets or indirectly by hands or freshly contaminated articles.</p> <p>Risk factors include: living in crowded conditions, day care attendance and older siblings in school.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Incubation Period</b>                                  | Ranges from 2 to 8 days; 4 to 6 days is most common.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Communicability</b>                                    | Shortly prior to and for the duration of active disease. In infants, RSV shedding may very rarely persist up to four weeks after clinical symptoms subside.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Susceptibility and Resistance</b>                      | <p>Susceptibility is universal. Illness is more frequent and more severe in infants, children and the elderly. Infection induces specific antibodies that are usually short-lived. Re-infection with RSV and parainfluenza viruses is common, but illness is generally milder.</p> <p>Illness severity is affected by conditions such as: age (under 3 months), prematurity, tobacco smoke exposure, congenital heart disease, underlying pulmonary disease, immunodeficiency, immunosuppression, lack of breastfeeding.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Public Health Management</b>                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Case</b>                                               | At this time individual cases do not require public health follow up.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Contacts</b>                                           | Contact management of community cases is not necessary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Outbreaks</b>                                          | <p>For Nunavut purposes an RSV outbreak is defined as:</p> <ul style="list-style-type: none"> <li>• A single laboratory confirmed RSV case <b>AND</b></li> <li>• Community clinics reporting above expected levels of a respiratory illness in infants that is clinically compatible with RSV.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Prevention Messaging</b>                               | <p>Prophylaxis of eligible children is effective in preventing illness and reducing the impact of disease. Synagis® (Palivizumab) is an antibody available for RSV prevention. Refer to the Synagis® Immunization Program section of the Nunavut Immunization Manual for details.</p> <p><b>Note: Synagis provides passive immunity, thus missed doses leave patients unprotected. Evidence suggests Synagis compliance in Nunavut has been sub-optimal, thus further encouragement should be provided to adhere to the schedule.</b></p> <p>Basic personal hygiene is also important in reducing transmission, e.g. covering nose and mouth when coughing or sneezing and regular hand hygiene. Also breastfeeding if possible, avoiding crowded places when there is respiratory illness in the community, and avoiding exposure to tobacco smoke is important to preventing viral transmission. Advise parents or caregivers of children who are ill to stay away from common settings like daycare or school to limit exposure to others, especially those at high risk for complications, until they are feeling well.</p> |
| <b>Health Settings Management</b>                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Infection Control Measures in Health Care Settings</b> | <p>Use routine practices and droplet/contact precautions.</p> <p>When triaging, suspect RSV cases should be placed in a separate room away from other patients as soon as possible or separated by at least two meters from other people waiting if it is not possible to use another room.</p> <p>Individuals suspected to have RSV should be instructed to put on a surgical/procedural mask (with ear loops) while they are in the clinic, if tolerated. This is not applicable to children.</p> <p>Diligent hand hygiene using either liquid soap and water or 60-90% alcohol-based sanitizer, before <b>and</b> after patient contact/assessment and after contact with contaminated equipment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Approval

Approved by Dr. Kim Barker, Chief Medical Officer of Health on May 31, 2016.

## 9.8.1 Severe Acute Respiratory Syndrome (SARS)

### Special Precautions/Considerations

Precautions: Droplet, direct and indirect precautions

#### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

| <b>Infectious Agent</b>              | Severe Acute Respiratory Syndrome (SARS) is caused by a coronavirus similar on electron microscopy to animal coronaviruses. Coronaviruses are large, enveloped RNA viruses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Clinical</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Clinical Presentation</b>         | <p>SARS illness generally presents with malaise, myalgia and fever, quickly followed by respiratory symptoms including cough and shortness of breath. Diarrhea may occur.</p> <p>Symptoms may worsen for several days coinciding with viraemia at 10 days after onset. Nearly all confirmed infected adult cases developed pneumonia or acute respiratory distress syndrome.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Diagnostics</b>                   | Consult your local laboratory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Treatment</b>                     | Consult with physician.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Occurrence</b>                    | <p><b>Worldwide:</b> First recognized in February 2003, the disease is thought to have originated in the Guangdong province of China, with emergence into human populations sometime in November 2002. By July 2003, major outbreaks had occurred at 6 sites, with disease occurrence reported in more than 20 additional sites throughout the world, following major airline routes. Most cases occurred in hospitals and among families and close contacts of hospital workers. There have been no cases of SARS identified since the 2003 outbreaks.</p> <p><b>Canada:</b> The first case of SARS was detected in Toronto, which was the epicenter of the outbreak in Canada. In all, there were 251 cases of SARS diagnosed in Canada, mostly in the Toronto area; 43 patients died.</p> <p><b>Nunavut:</b> No reported cases.</p> |
| <b>Reservoir</b>                     | Unknown.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Transmission</b>                  | <p>SARS is transmitted from person-to-person by close contact (i.e. within 1 or 2 meters); caring for, living with, or direct contact with infectious respiratory secretions or body fluids of a suspected, or confirmed case of SARS.</p> <p>The virus is thought to be transmitted most readily through respiratory droplets and possibly fomites (a surface or object contaminated with infectious droplets).</p>                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Incubation Period</b>             | 3–10 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Communicability</b>               | <p>Not yet completely understood. Initial studies suggest that transmission does not occur before onset of clinical signs and symptoms, and that maximum period of communicability is less than 21 days.</p> <p>During the 2003 outbreak, health workers were at great risk of disease acquisition, especially when exposed to aerosol-generating procedures such as intubations. In 2003, health care workers served as an entry point of the disease into the community in North America.</p>                                                                                                                                                                                                                                                                                                                                        |
| <b>Susceptibility and Resistance</b> | Unknown but susceptibility is assumed to be universal. At present race and sex do not appear to alter susceptibility. Because of the small number of cases                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 10.0 Vectorborne and Zoonotic Infections

### Purpose

The purpose of this section of the Communicable Disease Manual is to provide guidelines for the investigation and management of individuals who have been diagnosed with notifiable infections spread by vectorborne and zoonotic routes, including Anthrax, Brucellosis, Hantavirus, Lyme disease, Malaria, Plague, Rabies, Tularemia, West Nile Virus, and Yellow Fever.

### Legislation/Policy

Authority for the reporting of notifiable infections spread by vectorborne and zoonotic routes and their public health management comes from the *Public Health Act, Communicable Disease Regulations*.

All clients who have been diagnosed with notifiable infections spread by vectorborne and zoonotic routes must be reported to the Chief Medical Officer of Health (CMOH).

All clients who are suspected to have or have a confirmed notifiable infection spread by vectorborne and zoonotic routes are to be followed as per the protocols in this section.

### Roles and Responsibilities

**Table 10.1: Roles and responsibilities for follow up of notifiable infections spread by vectorborne and zoonotic routes**

| Role                                                                                                                                | Responsibilities                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Clinical Presentation</b> | <p>Depending on the route of transmission of infection, there are four clinical syndromes:</p> <ol style="list-style-type: none"> <li>(1) <b>Cutaneous Anthrax:</b> Characterized by initial itching of exposed skin, an initial vesicle at the site of inoculation develops into a painless black eschar; fever, malaise and headache may be present.</li> <li>(2) <b>Inhalational Anthrax:</b> The most lethal form of disease. Initial presentation includes, sweats, malaise, mild cough, dyspnea, nausea or vomiting, and this is followed by acute onset of respiratory distress and shock; there is also radiological evidence of mediastinal widening and pleural effusion present. Fatality rate is extremely high.</li> <li>(3) <b>Anthrax meningitis:</b> Begins with hypotension, quickly followed by delirium or coma; refractory seizures, cranial nerve palsies, and myoclonus have been reported.</li> <li>(4) <b>Intestinal Anthrax:</b> Presents with acute vomiting, abdominal distension, gastrointestinal bleeding, and peritonitis. Symptoms of oropharyngeal Anthrax include fever, neck swelling due to lymphadenopathy, throat pain, oral ulcers and sepsis.</li> </ol> |
| <b>Diagnostics</b>           | Consult your regional laboratory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Treatment</b>             | Consult with physician.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Spores may remain dormant in soil potentially infecting animals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Transmission</b>          | Transmission occurs by inoculation through open skin via contact with infected animal tissue, other animal products and contaminated soil and by ingestion of undercooked, contaminated or raw meat. Inhalation Anthrax results from the inhalation of anthrax spores, particularly in risky industrial settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Incubation Period</b>     | 1-7 days (possibly up to 60 days)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Communicability</b>       | Person-to-person transmission is rare. Articles and soil contaminated with spores may remain infective for years.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Susceptibility</b>        | There is some evidence of inapparent infection among people in frequent                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Infectious Agent</b>      | Brucellosis is caused by the bacterium <i>Brucella</i> . <i>Brucella</i> species are small, nonmotile, gram negative coccobacilli. The species that infect humans include <i>B. suis</i> , <i>B. abortus</i> , <i>B. melitensis</i> and rarely <i>B. canis</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Clinical Presentation</b> | <p>Onset of Brucellosis may be acute or insidious. It is a systemic infection characterized by fever (continuous, intermittent or irregular), headache, weakness, sweating, chills, arthralgia, depression, weight loss or generalized aching. Localized infections of organs, including the liver and spleen, may be present.</p> <p>Infection may last for several days, months or occasionally for more than a year if not adequately treated. Most cases recover, however, relapses may occur in untreated persons. The case-fatality rate of untreated Brucellosis is less than 2% and usually results from endocarditis.</p> <p>Osteoarticular complications are seen in up to 60% of cases. Genitourinary involvement occurs in up to 20% of cases, with orchitis and epididymitis being reported most commonly.</p>              |
| <b>Diagnostics</b>           | <p>Diagnosis is made by isolation of the infectious agent from an appropriate clinical specimen. Diagnosis may also be made by serology when paired sera show a rise in antibody titre (see Case Definition section). Interpretation of serologic tests in "chronic" and recurrent cases is especially difficult since titres are usually low.</p> <p>Follow your regional laboratory procedures for testing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Treatment</b>             | <p>Treatment depends on clinical symptoms and the age of the case, and is usually prescribed for six weeks to prevent reoccurring infection. Antibiotics (i.e., doxycycline and rifampin) are effective against <i>Brucella</i>. It usually requires the administration of more than one antimicrobial for several weeks. Provide supportive care for specific symptoms as indicated.</p> <p>Consult with physician for treatment recommendations.</p>                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Occurrence</b>            | <p><b>Worldwide:</b> Worldwide, especially in Mediterranean countries, Middle East, Africa, Central and South America, India and Mexico. The disease is often unrecognized and unreported. Brucellosis is predominantly an occupational disease of those who work with infected animals or their tissues, especially farm workers, veterinarians, meat inspectors and abattoir workers. There have been reports of isolated cases of infection with <i>B. canis</i> occurring in animal handlers from contact with dogs. Infection is common in those who eat raw caribou.</p> <p><b>Canada:</b> Brucellosis is uncommon in Canada. An average of 10 cases per year has been reported since 1989.</p> <p><b>Nunavut:</b> Since 2000, there has been an average of a single case per year, case counts range from 0-3 cases per year.</p> |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reservoir</b>                     | Animal reservoirs include cattle, swine, goats, sheep, elk, bison, caribou, and some species of deer, coyotes, and occasionally dogs. New species have been found in marine mammals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Transmission</b>                  | Transmission occurs through contact with infected tissues, blood, urine, vaginal discharge, aborted fetuses, or through the ingestion of raw milk or cheese from infected animals. Airborne inhalation in laboratories and abattoirs has also been reported, as has sexual transmission. Transmission from person-to-person is extremely rare. Mothers who are breastfeeding may transmit infection to their infants.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Incubation Period</b>             | The incubation period is variable and difficult to ascertain; usually 5-60 days, commonly 1-2 months, occasionally several months.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Communicability</b>               | There is no evidence of person-to-person transmission.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Susceptibility and Resistance</b> | The severity and duration of the illness varies widely and the duration of acquired immunity following infection is uncertain.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Case</b>                          | <p>Confirm the diagnosis – ensure that all suspect cases receive prompt investigative procedures to confirm the case. Contact and interview the case, parent or guardian. Complete the <a href="#">Communicable Disease Report Form</a> dated September 2013 or later (section 10.2.2).</p> <p>Investigate cases of Brucellosis to determine the source of infection, being sure to obtain the following disease-specific information:</p> <ul style="list-style-type: none"> <li>• History of exposure to possible sources based on specific species identified on culture (in the past 60 days).</li> <li>• Food history (retain suspected food or water for laboratory analysis based on Environmental Health Officer [EHO] direction).</li> <li>• History of occupational risks (see Transmission section).</li> <li>• History of recent (international) travel.</li> <li>• History of past infection, as relapses of prior infection can occur.</li> </ul> <p>Provide Health Education to case on transmission and prevention of the disease.</p> |
| <b>Contacts</b>                      | Investigate contacts (symptomatic and asymptomatic), such as co-workers and household members, to identify people who may have been exposed to the same source and who could also be infected. Provide Health Education to contacts on transmission and prevention of the disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Outbreaks</b>                     | If a higher than normal amount of disease activity is detected, contact your EHO.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Approval

Approved by Dr. Maureen Baikie, Chief Medical Officer of Health on March 17, 2014.

## 10.3.1 Hantavirus Pulmonary Syndrome/Viral disease

### Special Precautions/Considerations

Precautions: Routine

#### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Infectious Agent</b>              | Hantaviruses are RNA viruses that are a part of the <i>Bunyaviridae</i> family. More than 25 antigenically distinguishable viral species exist, each associated primarily with a single rodent species.                                                                                                                                                                                                 |
| <b>Clinical</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Clinical Presentation</b>         | Hantavirus Pulmonary Syndrome infection often presents as a “flulike” illness, with fever, intense headache, myalgia, nausea and other gastrointestinal symptoms; this is followed by cough, shortness of breath, dizziness, sweats and arthralgia (usually within 5 days) and then pulmonary edema and deterioration of cardiopulmonary function may rapidly occur. The crude fatality rate is 40-50%. |
| <b>Diagnostics</b>                   | Consult your regional laboratory.                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Treatment</b>                     | Consult with physician.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Occurrence</b>                    | <p><b>Worldwide:</b> The disease was first recognized in 1993 in Southwest USA, but has been reported worldwide. Incidence appears to coincide with the distribution and population density of infected carrier rodents and their infection levels.</p> <p><b>Canada:</b> Rare, with sporadic cases. Made nationally notifiable in 2000.</p> <p><b>Nunavut:</b> No reported cases.</p>                  |
| <b>Reservoir</b>                     | The major reservoir in North America is the deer mouse, found primarily in rural and semi-rural areas, often in barns and old buildings.                                                                                                                                                                                                                                                                |
| <b>Transmission</b>                  | Infected rodents shed live virus in their saliva, feces and urine; transmission primarily occurs through inhalation of aerosolized rodent saliva, urine or feces; through the bites of infected rodents; and through direct contact of broken skin or mucous membrane with rodent excreta.                                                                                                              |
| <b>Incubation Period</b>             | Not completely defined, however most often it has been found to be approximately 2 weeks after exposure, with a range from a few days to 6 weeks.                                                                                                                                                                                                                                                       |
| <b>Communicability</b>               | No person-to-person spread documented in North America, however there have been reports of person-to-person spread of the Andes virus strain in an outbreak in Argentina.                                                                                                                                                                                                                               |
| <b>Susceptibility and Resistance</b> | All persons without prior infection are presumed to be susceptible, however protection and duration of immunity from previous infection is unknown. Rural dwellers, cottagers and campers are most at risk in endemic areas. Also any indoor exposure in closed, poorly ventilated areas with viable rodent infestation increases susceptibility to infection.                                          |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Infectious Agent</b>              | Lyme disease is a tick-borne zoonotic disease caused by the bacterium, <i>Borrelia burgdorferi</i> ( <i>B. burgdorferi</i> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Clinical</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Clinical Presentation</b>         | <p>Lyme borreliosis is generally divided into 3 stages:</p> <p>(1) <b>Early localized disease:</b> Erythema migrans (EM) or “bull’s eye” rash at the site of a recent tick bite, fever, malaise, headache, myalgia, neck stiffness, and arthralgia.</p> <p>(2) <b>Early disseminated disease:</b> Multiple erythema migrans in approximately 15% of people occurs several weeks after infective tick bite, cranial nerve palsies, lymphocytic meningitis, conjunctivitis, arthralgia, myalgia, headache, fatigue, carditis (heart block).</p> <p>(3) <b>Late disease:</b> May develop in people with early infection that was undetected or not adequately treated. Involves the heart, nervous system and joints; arrhythmias, heart block, significant myocardial dysfunction; recurrent arthritis affecting large joints (i.e. knees); peripheral neuropathy; central nervous system manifestations – meningitis; encephalopathy (i.e. behavior changes, sleep disturbance, headaches).</p> |
| <b>Diagnostics</b>                   | Consult your regional laboratory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Occurrence</b>                    | <p><b>Worldwide:</b> Lyme disease has been found in Canada, the USA, Europe, the former Soviet Union, China and Japan.</p> <p><b>Canada:</b> Populations of infected ticks are established in southern parts of Manitoba, Ontario and Quebec, areas of New Brunswick and Nova Scotia, and in southern British Columbia. With climate change areas with infected ticks is expected to expand.</p> <p><b>Nunavut:</b> No reported cases.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Reservoir</b>                     | Deer and small mammals such as rodents serve as important hosts to the tick vector, <i>Ixodes scapularis</i> , the primary <i>B. burgdorferi</i> vector in eastern Canada.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Transmission</b>                  | Tick-borne: transmission usually does not occur until the tick has been attached for at least 24 hours.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Incubation Period</b>             | For EM rash, 7-10 days (range 3-32 days) after tick exposure; early stages of the illness may not be apparent and the person may present with later manifestations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Communicability</b>               | There is no evidence of person-to-person spread.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Susceptibility and Resistance</b> | All persons are probably susceptible, particularly persons that live in or travel to Lyme disease endemic areas.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Infectious Agent</b>      | Malaria is caused by protozoan parasites of the genus <i>Plasmodium</i> . Four species of <i>Plasmodium</i> infect humans: <i>P. vivax</i> , <i>P. ovale</i> , <i>P. malariae</i> and <i>P. falciparum</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Clinical Presentation</b> | <p>Falciparum Malaria often causes varied symptoms, including fever, chills, sweats, cough, diarrhea, respiratory distress and headache, and may progress to jaundice, shock, bleeding, kidney and liver failure, and signs of brain involvement (disorientation, delirium, coma and death).</p> <p>The other parasites infecting humans are more benign. The illness usually begins with lethargy and a slowly rising fever over several days. It then progresses to shaking chills and a sudden rise in temperature, with nausea and headache; the temperature then suddenly falls with profuse sweating. After a fever-free interval the cycle repeats itself, either daily, every other day, or every third day or longer if untreated. The first attack lasts for about 1 month if left untreated. Subsequent relapses may occur over the ensuing years until partial or complete immunity results.</p> |
| <b>Diagnostics</b>           | Consult your regional laboratory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Treatment</b>             | Consult with physician.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Occurrence</b>            | <p><b>Worldwide:</b> Malaria no longer occurs in temperate zone countries such as Canada. It is a major cause of illness and death in many tropical and subtropical areas in South America, Southeast Asia and parts of sub-Saharan Africa. The occurrence of antibiotic-resistant Malaria in many parts of the world is a major concern.</p> <p><b>Canada:</b> Malaria transmission in Canada does not occur. All reported cases have acquired their infections while travelling abroad.</p> <p><b>Nunavut:</b> No reported cases.</p>                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Reservoir</b>             | Humans                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Transmission</b>          | The disease is transmitted to humans through the bite of an infected female <i>Anopheles</i> mosquito. The disease may also be transmitted through injection or transfusion of infected blood; congenital transmission rarely occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Incubation Period</b>     | The time between an infective bite and the appearance of clinical symptoms for <i>P. falciparum</i> is 9-14 days; 12-18 days for <i>P. vivax</i> and <i>P. ovale</i> and 18-40 days for <i>P. malariae</i> . Delayed primary attacks by some <i>P. vivax</i> strains may occur 6-12 months after exposure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Communicability</b>       | <p>Mosquitoes may acquire the parasites from infected humans as long as the gametocytes are present in the blood; this varies with parasite species and with response to therapy.</p> <p>Untreated or insufficiently treated patients may be a source of mosquito infection for several years, depending on the strain 1-5 years.</p> <p>Transfusion transmission may occur as long as asexual forms remain in the circulating blood (with <i>P. malariae</i> up to 40 years or longer). Stored blood can remain infective for at least one month.</p>                                                                                                                                                                                                                                                                                                                                                       |

|                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Susceptibility and Resistance</b>                      | <p>Susceptibility is universal. Those most at risk are persons travelling to malaria-endemic areas who are not protected by chemoprophylaxis.</p> <p>It appears that African-Americans show a natural resistance to <i>P. vivax</i> and persons with sickle cell traits show a natural resistance to <i>P. falciparum</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Approved by Dr. Maureen Baikie, Chief Medical Officer of Health on January 2, 2014.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                |

## 10.6.1 Plague

### Special Precautions/Considerations

Precautions: Routine and Droplet

#### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Infectious Agent</b>      | The causative agent of Plague is <i>Yersinia pestis</i> , a gram negative coccobacillus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Clinical Presentation</b> | <p>Clinical illness is characterized by fever, chills, headache, malaise, prostration, and leukocytosis manifesting in one or more of the three main forms of Plague in humans:</p> <ol style="list-style-type: none"> <li>(1) <b>Bubonic Plague:</b> The most common form of human Plague, resulting from a flea bite. It presents as acute lymphadenitis in lymph nodes that drain the site of a fleabite (forms a bubo) and occurs more often in inguinal nodes and less commonly in axillary and cervical nodes. Lymph nodes become swollen and tender and may suppurate; fever is present.</li> <li>(2) <b>Septicemic Plague:</b> All forms of Plague, including those without lymphadenopathy may progress to Septicemic Plague with dissemination by the bloodstream to diverse parts of the body.</li> <li>(3) <b>Pneumonic Plague:</b> An infection of the lungs caused by the Plague bacillus. Secondary involvement of the lungs results in pneumonia; mediastinitis or pleural effusion may develop. Secondary Pneumonic Plague is of special significance, since respiratory droplets may serve as the source of person-to-person transfer with resultant Primary Pneumonic or Pharyngeal Plague.</li> </ol> <p>Untreated Bubonic Plague has a fatality rate of 50%, Pneumonic and Septicemic Plagues are fatal if not treated.</p> |
| <b>Diagnostics</b>           | Consult your regional laboratory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Infectious Agent        | <p>Rabies virus is an RNA virus classified in the Rhabdoviridae family. There are different variants of the virus depending on the species e.g. fox strain or bat strain. However, a specific variant can be found in a different species e.g. bat rabies in a cat.</p> <p>The virus is easily killed by sunlight, soap and drying.</p>                                                                                                                                                                                                                                                                                                                                                     |
| Reservoir               | <p>Rabies is a disease of mammals, both domestic and wild. In North America the main reservoir species are wild animals such as foxes, coyotes, wolves, skunks, raccoons, and bats.</p> <p>In Nunavut and the Northwest Territories (NWT) the virus is endemic in terrestrial carnivores (foxes and wolves) but other mammals may be infected, e.g. caribou, polar bear, dogs, cats.</p>                                                                                                                                                                                                                                                                                                    |
| Transmission            | <p>Rabies is primarily a disease of animals but can be transmitted to humans when virus in the saliva of an infected animal enters through a bite, scratch, broken skin or mucous membranes. The virus then gains access to the central nervous system through peripheral nerves.</p> <p>Bites from an infected animal are the main route of exposure.</p> <p>Person to person transmission is theoretically possible but rare and not well documented. Transmission through corneal, solid organ and blood vessel transplant from unsuspected rabies cases has occurred. Airborne spread has been demonstrated in caves where bats roost and in laboratory settings but occurs rarely.</p> |
| Risk Factors            | <p>People who work in close contact with animals, such as veterinarians, veterinary staff, animal control and wildlife workers and laboratory workers who handle rabies virus are at higher risk of exposure to rabies. Individuals who engage in activities such as hunting and trapping that place them in close contact with potentially rabid animals may also be considered at higher risk of exposure.</p> <p>Children are considered at higher risk for exposure to rabies because they are more likely to approach animals and are less likely to report bites or scratches. Additionally, children may be more likely to be bitten on the face,</p>                                |

|                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                                               | which carries a higher risk of infection and bites to children can be severe.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Occurrence in humans                          | <p><b>Worldwide:</b> There are an estimated 65,000-87,000 deaths per year with most cases occurring in Asia and Africa. Most cases are due to inadequate post-exposure prophylaxis following a dog bite.</p> <p><b>Canada:</b> Since records began in 1924 until 2009, 24 people in 6 provinces have died as a result of the disease.</p> <p><b>Nunavut:</b> While no deaths due to rabies have been recorded in the area that is now Nunavut, the rabies virus is endemic in terrestrial carnivores.</p>                                                                                                                                                                                                                                                     |
| Incubation Period                             | <p><b>Animals:</b></p> <p>The incubation period and the manifestation of rabies vary in different species. The length of time virus may be excreted in saliva before the development of symptoms (asymptomatic carriage) has not been determined for the purpose of defining rabies exposure except in dogs, cats and ferrets. In dogs, cats and ferrets, rabies virus excretion does not generally precede symptom development beyond 10 days.</p> <p><b>Humans:</b></p> <p>Usually 3-8 weeks (9 days-7 years). The incubation period depends on wound severity, wound site in relation to nerve supply and distance from the brain, the amount and strain of virus, protection provided by clothing and other factors such as adequate wound cleansing.</p> |
| Communicability                               | Rabid animals are infectious from the time the virus reaches the salivary glands and up until death. Death usually occurs within one week of onset of clinical signs. Different species may shed virus in saliva for different lengths of time prior to onset of clinical signs: dogs/cats/ferrets for 3 to 7 days (rarely over 4 days), longer with wildlife.                                                                                                                                                                                                                                                                                                                                                                                                |
| Susceptibility and Resistance                 | <p>All terrestrial mammals are susceptible to rabies.</p> <p>Humans appear to be more resistant to infection as evidenced in a study where 40% of untreated individuals bitten by proven rabid animals developed the disease.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Clinical Presentation of <b>Animal Rabies</b> | <p>Animals with rabies may show a variety of clinical signs. The disease can appear in two forms:</p> <p><b>Dumb rabies</b></p> <ul style="list-style-type: none"> <li>• Domestic animals may become depressed and try to hide in isolated places.</li> <li>• Wild animals may lose their fear of humans and appear unusually friendly.</li> <li>• Wild animals that usually only come out at night may be out during the day.</li> <li>• Animals may have paralysis. Areas most commonly affected are the face or neck (which causes abnormal facial expressions or drooling) or the hind</li> </ul>                                                                                                                                                         |

|                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

They may even bite or chew their own limbs.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Clinical Presentation of <b>Human Rabies</b>                        | <p>Rabies is an almost always fatal viral infection of the central nervous system. Early symptoms may include headache, malaise, fever and fatigue. There may be discomfort or pain at the exposure site (i.e. the site where the person was bitten). Symptoms progress quickly as the central nervous system is attacked, and the illness generally presents in one of two ways. The more common, agitated (furious) form presents with the classic symptoms of hydrophobia and aerophobia (severe laryngeal or diaphragmatic spasms and a sensation of choking when attempting to drink or when air is blown in the face) with rapidly progressing encephalitis and death. The paralytic form of the disease manifests in progressive flaccid paralysis, has a more protracted course, and is more difficult to diagnose.</p> |
| Diagnostics                                                         | <p>Animals:</p> <p>Diagnosis of rabies in an animal requires testing usually a fluorescent antibody test of brain tissue sampled from the dead animal. This is done by the Canadian Food Inspection Agency in their laboratory.</p> <p>Humans:</p> <p>Presumptive diagnosis may be based on specialized serological testing and other specialized tests done for suspect rabies at a tertiary care facility by a specialist.</p>                                                                                                                                                                                                                                                                                                                                                                                                |
| Treatment                                                           | <p>Treatment for humans is available and provided at tertiary care centers but is rarely successful.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Protocol for the follow-up of a patient exposed to an animal</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Health Education

Actions taken by the general public play an important role in preventing human cases of rabies. Provide the public with rabies information including symptoms and avoiding unprovoked animal encounters. Key messages include:

- All wild animals potentially infected with rabies that have exposed a person must be observed or tested if available.
- Individuals in high risk groups including, veterinarians, lab workers, wildlife workers and conservationists, lay vaccinators and individual traveling to areas where rabies is endemic should be immunized.
- Pet owners should be aware of the signs and symptoms of rabies per the Signs and symptoms of animal rabies fact sheet.
- The dangers of picking up dead, sick or hurt animals or domesticating wild animals.
- Do not feed wild animals or leave leftover food around yards, parks etc. as it may attract wild animals.
- Vaccinate animals in close contact with humans i.e. pets, sled dogs.

## Approval

Approved by Dr. Kim Barker, Chief Medical Officer of Health June 5, 2018.

### To be appended:

1. Table 1. Protocol for the follow up of a patient with an animal exposure.
2. Animal Incident Reporting Form
3. Rabies Post Exposure Prophylaxis (PEP) Schedule Form

**Table 1. Protocol for the Follow-up of a Patient with an Animal Exposure**

---

**Step 1: Health Care Provider (HCP) to assess the patient presenting with an animal exposure.**

---

- o Obtain a detailed history of the incident and the animal involved using the Animal Incident Report Form (Appendix A).
- o Assess and treat the wound as per wound treatment protocols in consultation with the community physician as required.
- o Check the patient's immunization record and chart for previous rabies vaccine, rabies immune globulin or rabies titres and tetanus immunization.
- o Send the completed form to the EHO.

**Report to the EHO while the patient is still in the clinic if possible.**

---

**Notes:**

- o The most effective procedure to prevent rabies is immediate and thorough cleaning and flushing of the wound.
  - o A history obtained from a child or a cognitively impaired adult may be unreliable.
- 

**Step 2: EHO and HCP to assess the exposure.**

---

- o The EHO will discuss the report with the HCP **as soon as possible** with particular attention to:
    - o Reliability of the exposure history
    - o Details on the type of exposure (bite i.e. penetration of skin by teeth, non-bite)
    - o The location and severity of the patient's wound
    - o Can a bite or saliva exposure into a scratch, wound or mucous membrane be ruled out? Can exposure to neural tissue be ruled out?
  - o If the patient **was not exposed**, no post exposure prophylaxis (PEP) is required. The EHO will complete the follow up portion of the form and return a copy to the HCP to be included on the chart.
  - o If the patient **was exposed**, the EHO will assess the likelihood that the attacking animal has rabies as per **Step 3**.
- 

**Notes:**

- o Rabies is only transmitted when the virus is introduced into a bite wound, open cuts in skin or onto mucous membranes such as the mouth or eyes.
  - o Rabies transmission occurs most commonly through a bite. Bites on the **face, neck or hand**
-

- 
- are considered higher-risk exposures due to the density of nerve endings in these areas.
  - o Non-bite exposure involves salivary contact on open skin (scratch or open wound) or mucous membrane. Transmission from non-bite exposures is rare.
  - o Petting a rabid animal or handling its blood, urine or feces are not considered exposures.
- 

### **Step 3: EHO to assess the likelihood of the animal having rabies.**

---

The EHO will assess the risk of the attacking animal having rabies taking the following factors into account:

- o The circumstances of the incident e.g. provoked or unprovoked
  - o The type of attacking animal: a domestic pet, a wild animal or a stray animal?
  - o The behaviour of the attacking animal
- 

#### **Notes:**

- o More severe bites may suggest that the animal is rabid and also provide more opportunity for transmission.
  - o An unprovoked attack is more likely to indicate that the attacking animal is rabid although rabid animals may become uncharacteristically quiet.
  - o Provoking an animal includes:
    - o attempting to feed or handle an animal
    - o trapping or cornering an animal
    - o approaching an injured animal
    - o abusing the animal such as hitting a dog with a stick or pulling a cat's tail.
  - o Domestic dogs and cats kept indoors and supervised at all times while outdoors, are at low to no risk of rabies.
  - o Domestic pets with up-to-date rabies vaccine are unlikely to be infected with rabies.
  - o In domestic animals, abnormal behaviour may indicate the animal is rabid.
  - o Sled dogs, dogs tied outdoors, stray dogs or cats are more at risk of rabies.
  - o If a dog, or cat or ferret is healthy 10 days after it attacked a person it would not have been infectious at the time of exposure.
  - o Squirrels, hamsters, gerbils, sik-siks, small rodents, rabbit and hares etc. rarely have rabies as they are likely to be killed by the larger animal that could have transmitted rabies to them. PEP would only be considered if the animal's behavior is highly unusual.
  - o Generally, it is not possible to assess animal behavior in wild animals.
- 

### **Step 4: EHO/MOH to recommend post exposure prophylaxis (PEP) or not.**

The HCP is responsible to:

- o counsel the patient on the risk of rabies and the risk and benefits of PEP if recommended
  - o administer PEP as per the rabies protocol in Section 11 of the Nunavut Immunization Manual for information on the dose and schedule etc. taking the following points into account:
    - o PEP for an exposed person not previously immunized against rabies **includes vaccine**
-

and rabies immune globulin (RIG) and is different from someone previously immunized against rabies

- o give PEP as per the schedule even on the weekend
- o consult with the RCDC (MOH after hours) on vaccination related questions including re-scheduling missed doses
- o inform EHO of non-compliance with recommendations
- o Send the Rabies Post Exposure (PEP) Schedule Form to the EHO once the first dose of vaccine and RIG is administered and when the series is complete

The EHO is responsible to:

- o assess the risk in consultation with EHS/MOH as necessary
- o advise the HCP of the decision regarding post exposure prophylaxis (PEP)
- o follow up and manage the attacking animal. The HCP does not need to deal with the animal.
- o inform the HCP of the outcome of animal testing or quarantine if done
- o advise the HCP if PEP should be stopped based on animal testing or quarantine results
- o follow up with the HCP if PEP was recommended:
  - o On day 1 to determine if rabies vaccine and rabies immune globulin were provided as recommended.
  - o On day 5 to determine compliance
  - o On day 15 to determine if the rabies vaccine series was completed

---

**Step 5: Complete follow-up and close the file.**

---

## 10.8.1 Tularemia

### Special Precautions/Considerations

Precautions: Routine

#### Reporting

Notifiable: Yes

Reporting: Routine (within 7 days)

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Infectious Agent</b>              | Tularaemia (also known as rabbit fever) is a zoonotic bacterial disease caused by the bacterium <i>Francisella tularensis</i> ( <i>F. tularensis</i> ), which is a small, Gram-negative nonmotile coccobacillus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Clinical</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Clinical Presentation</b>         | <p>Clinical presentation is typically sudden with an abrupt onset of fever, chills, myalgia and headache. Illness usually conforms to one of several tularemic syndromes, including:</p> <ul style="list-style-type: none"> <li>(1) <b>Ulceroglandular:</b> Cutaneous ulcer with regional lymphadenopathy at the entry site (most common).</li> <li>(2) <b>Glandular:</b> Regional lymphadenopathy with no ulcer.</li> <li>(3) <b>Oculo-glandular:</b> Conjunctivitis with preauricular lymphadenopathy.</li> <li>(4) <b>Oropharyngeal:</b> Stomatitis or pharyngitis, or tonsillitis and cervical lymphadenopathy.</li> <li>(5) <b>Intestinal:</b> Intestinal pain, vomiting, and diarrhea.</li> <li>(6) <b>Pneumonic:</b> Primary pleuropulmonary disease.</li> <li>(7) <b>Typhoidal:</b> Febrile illness without early localizing signs and symptoms.</li> </ul> |
| <b>Diagnostics</b>                   | Consult your regional laboratory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Treatment</b>                     | Consult with physician.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Occurrence</b>                    | <p><b>Worldwide:</b> The disease is endemic in North America, as well as much of Europe and Asia.</p> <p><b>Canada:</b> Rare, sporadic cases reported.</p> <p><b>Nunavut:</b> No reported cases.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Reservoir</b>                     | Wild animals, especially rabbits, hares, voles, muskrats, beavers and some domestic animals, as well as various ticks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Transmission</b>                  | <p>Common routes for human transmission include: (1) inoculation of the skin or mucous membranes with blood or tissue of animals, while handling infected animals, (2) bites from infected deerflies or ticks, or (3) handling or eating insufficiently cooked meat of infected animals.</p> <p>Less common means of spread include drinking contaminated water, inhaling dust from contaminated soil, or handling contaminated pelts or paws of animals.</p>                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Incubation Period</b>             | Related to size of inoculum; usually 3-5 days (range of 1-14 days).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Communicability</b>               | <p>No person-to-person spread.</p> <p>Flies are infective for 14 days and ticks throughout lifetime (two years); frozen rabbit meat has remained infective for more than three years.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Susceptibility and Resistance</b> | All ages are susceptible, and long term immunity follows recovery; reinfection is extremely rare and has been reported only in laboratory staff.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Approval</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                |
| Approved by Dr. Maureen Baikie, Chief Medical Officer of Health on January 3, 2014.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                |

## 10.9.1 West Nile Virus

### Special Precautions/Considerations

Precautions: Routine

#### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Infectious Agent</b>              | West Nile Virus (WNV) is a mosquito-borne virus of the genus Flavivirus; it is an RNA Flavivirus, which is related antigenically to St. Louis Encephalitis and the Japanese Encephalitis viruses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Clinical</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Clinical Presentation</b>         | <p>There are three clinical manifestations of WNV; asymptomatic, non-neurological and neurological. The majority of WNV cases are asymptomatic.</p> <p>About 20% of infected persons develop the usually less severe symptom complex known as WNV non-neurological syndrome. This presents with a mild flu-like illness with fever, headache and body aches, occasionally with a skin rash and swollen lymph nodes or other non-specific symptoms that last several days. Other symptoms may include nausea, vomiting, eye pain or photophobia.</p> <p>WNV neurological symptoms can present as an encephalitis illness as well as conditions similar to acute flaccid paralysis, and Parkinson's disease.</p> |
| <b>Diagnostics</b>                   | Consult your regional laboratory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Treatment</b>                     | Consult with physician.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Occurrence</b>                    | <p><b>Worldwide:</b> West Nile virus has been commonly found in Africa, Eastern Europe, West Asia, the Middle East and North America.</p> <p><b>Canada:</b> In Canada the virus was first confirmed in birds in 2001 and the first human case was confirmed in Ontario in September 2002. The risk of acquiring WNV is seasonal as it is dependent on mosquitoes. The majority of Canadian cases occur in August and September.</p> <p><b>Nunavut:</b> No reported cases.</p>                                                                                                                                                                                                                                  |
| <b>Reservoir</b>                     | Birds are the main reservoir of WNV in North America.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Transmission</b>                  | <p>Mosquitoes are the main vectors with the <i>Culex</i> genus being the primary vector.</p> <p>Indirect human transmission can occur through blood and organ donations, maternal to child transmission is very rare.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Incubation Period</b>             | Usually 2-15 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Communicability</b>               | No direct person-to-person transmission. Infected mosquitoes probably transmit virus throughout life.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Susceptibility and Resistance</b> | Susceptibility appears to be general and throughout life in both sexes at all ages. Persons over 50 years of age have the highest risk of severe disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|  | <p>confirmatory PRNT or other kind of neutralization assay is not required in a health jurisdiction/authority where cases have already been confirmed in the current year] <b>OR</b></p> <ul style="list-style-type: none"> <li>• Demonstration of Japanese encephalitis (JE) serocomplex-specific genomic sequences in blood by nucleic acid amplification test (NAT) screening on donor blood, by Blood Operators in Canada.</li> </ul> <p><b>Comments</b></p> <p><sup>1</sup> This category includes asymptomatic blood donors whose blood is screened using a Nucleic Acid Amplification Test (NAT), by Blood Operators (i.e. Canadian Blood Services or Hema-Quebec) and is subsequently brought to the attention of public health officials. The NAT that is currently used by Blood Operators in Canada is designed to detect all viruses in the Japanese encephalitis (JE) serocomplex. The JE serocomplex includes WN virus and nine other viruses, although from this group only WN virus and St Louis encephalitis virus are currently endemic to parts of North America. Blood Operators in Canada perform a supplementary WN virus-specific NAT and antibody (IgM and IgG) testing following any positive donor screen test result.</p> <p><sup>2</sup> Both CDC and commercial IgM / IgG ELISAs are now available for front line serological testing. Refer to appropriate assay procedures and kit inserts for the interpretation of test results.</p> <p><sup>3</sup> Early in infection the immune system generates antibodies that bind relatively weakly to viral antigen (low avidity). As the infection proceeds, an increasing percentage of newly generated IgG antibody displays higher binding affinity to virus antigen and thus avidity also rises (Note: avidity is usually measured based upon the ability of IgG to dissociate from antigen preparations after incubation with a solution of urea). As long as high avidity IgG is not yet detected in the serum it can be assumed that the individual was exposed to the viral agent during a recent exposure. With respect to WNV infection it has not been precisely determined when (i.e. post-exposure) high avidity antibodies reach levels in serum that can be accurately detected by serological assays (there may be significant variation depending on the individual). However, it has been shown that &gt; 95% of sera collected from individuals exposed to WNV 6-8 months previously will have IgG antibodies that bind strongly to viral antigen and will give high avidity scores using both indirect fluorescent antibody (IFA) and ELISA testing formats. <b>Note: Avidity testing will not replace confirmatory neutralization testing, non-WNV flavivirus IgG antibody (e.g., dengue, St Louis encephalitis [SLE]) may bind to the antigen preparations used in avidity assays.</b></p> <p>Note: WNV IgM antibody may persist for more than a year and the demonstration of IgM antibodies in a patient's serum, particularly in residents of endemic areas, may not be diagnostic of an acute WN viral infection. Seroconversion (by HI, IgG ELISA or PRNT assays) demonstrates a current WNV infection. Therefore, the collection of acute and convalescent sera for serologic analysis is particularly important to rule out diagnostic misinterpretation early in the WNV season (e.g. May, June) and to identify initial cases in a specific jurisdiction. However, it should be noted that seroconversions may not always be documented due to timing of acute sample collection (i.e. titres in acute sera may have already peaked). If static titres are observed in acute and convalescent paired sera, it is still possible the case may represent a recent infection. To help resolve this, the use of IgG avidity testing may be considered to distinguish between current and past infection.</p> |
|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The presence of both IgM antibody and low avidity IgG in a patient's convalescent serum sample are consistent with current cases of viral associated illness. However test results that show the presence of IgM and high avidity IgG are indicative of exposures that have occurred in the previous season. Immunocompromised individuals may not be able to mount an immune response necessary for a serological diagnosis. West Nile virus diagnostic test criteria for these individuals should be discussed with a medical microbiologist.

<sup>4</sup> History of exposure when and where West Nile virus transmission is present, or could be present, or history of travel to an area with confirmed WNV activity in mosquitoes, birds, horses, other mammals or humans.

<sup>5</sup> Alternative modes of transmission, identified to date, include: laboratory-acquired; in utero; receipt of blood components; organ/tissue transplant; and, possibly via breast milk.

<sup>6</sup> A person with WNV-associated acute flaccid paralysis may present with or without fever or mental status changes. Altered mental status could range from confusion to coma with or without additional signs of brain dysfunction (e.g. paralysis, cranial nerve palsies, sensory deficits, abnormal reflexes, generalized convulsions and abnormal movements). Acute flaccid paralysis with respiratory failure is also a problem.

Note: A significant feature of West Nile virus neurological illness may be marked muscle weakness that is more frequently unilateral, but could be bilateral. WNV should be considered in the differential diagnosis of all suspected cases of acute flaccid paralysis with or without sensory deficit. WNV- associated weakness typically affects one or more limbs (sometimes affecting one limb only). Muscle weakness may be the sole presenting feature of WNV illness (in the absence of other neurologic features) or may develop in the setting of fever, altered reflexes, meningitis or encephalitis. Weakness typically develops early in the course of clinical infection. Patients should be carefully monitored for evolving weakness and in particular for acute neuromuscular respiratory failure, which is a severe manifestation associated with high morbidity and mortality. For the purpose of WNV Neurological Syndrome Classification, muscle weakness is characterized by severe (polio-like), non-transient and prolonged symptoms. Electromyography (EMG) and lumbar puncture should be performed to differentiate WNV paralysis from the acute demyelinating polyneuropathy (Guillain-Barré syndrome). Lymphocytic pleocytosis (an increase in WBC with a predominance of lymphocytes in the cerebrospinal fluid [CSF]) is commonly seen in acute flaccid paralysis due to WNV. Other emerging clinical syndromes, identified in 2002 included, but were not limited to the following: myelopathy, rhabdomyolysis (acute destruction of skeletal muscle cells), peripheral neuropathy; polyradiculoneuropathy; optic neuritis; and acute demyelinating encephalomyelitis. Ophthalmologic conditions including chorioretinitis and vitritis were also reported. Facial weakness was also reported. Myocarditis, pancreatitis and fulminant hepatitis have not been identified in North America, but were reported in outbreaks of WNV in South Africa. "Aseptic" meningitis without encephalitis or flaccid paralysis occurring in August and September when WNV is circulating may be due to non-polio enteroviruses circulating at the same time. This should be considered in the differential diagnosis.

<sup>7</sup> It is possible that other clinical signs and symptoms could be identified that

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Infectious Agent</b>              | Yellow Fever is caused by the yellow fever virus: genus <i>Flavivirus</i> and family <i>Flaviviridae</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Clinical</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Clinical Presentation</b>         | <p>Yellow Fever is an acute viral disease of short duration and varying severity. The mildest cases may be clinically indeterminate.</p> <p>Typically, the clinical presentation is characterized by sudden onset of fever, chills, headache, backache, generalized muscle pain, prostration, nausea and vomiting. The pulse may be slow and weak out of proportion to the elevated temperature (Faget sign). Jaundice is moderate early in the disease and intensifies later.</p> <p>Most infections resolve after the 5<sup>th</sup> day, however some cases progress after a brief remission of hours to a day into the ominous stage of intoxication manifested by hemorrhagic symptoms including epistaxis, gingival bleeding, hematemesis (coffee ground or black), melaena and liver and renal failure. 20-50% of jaundiced cases are fatal.</p> |
| <b>Diagnostics</b>                   | Consult your regional laboratory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Treatment</b>                     | Consult with physician.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Occurrence</b>                    | <p><b>Worldwide:</b> Yellow Fever exists in nature in two transmission cycles, a sylvatic or jungle cycle that involves mosquitoes and nonhuman primates, and an urban cycle involving <i>Aedes aegypti</i> mosquitoes and humans. It is endemic in tropical areas of Africa and Latin America.</p> <p><b>Canada:</b> Transmission does not occur in Canada, reported cases are linked to travel.</p> <p><b>Nunavut:</b> No reported cases.</p>                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Reservoir</b>                     | Humans in urban areas; in forest areas, vertebrates other than humans, mainly monkeys and possibly marsupials.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Transmission</b>                  | Yellow Fever is transmitted via the bite of infected mosquitoes, primarily those of the genus <i>Aedes</i> . There is no human-to-human transmission.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Incubation Period</b>             | 3-6 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Communicability</b>               | Mosquitoes can acquire the virus from an infected person shortly before onset of fever and for the first 3-5 days of illness. The disease is highly communicable where many susceptible people and abundant vector mosquitoes coexist; it is not communicable through contact or common vehicles. <i>Aedes aegypti</i> mosquitoes require 9-12 days after a blood meal to become infectious and remain so for life.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Susceptibility and Resistance</b> | Vaccine preventable; recovery from Yellow Fever is followed by lasting immunity; mild unapparent infections are common in endemic areas; previous infections with dengue give some degree of immunity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## 11.0 Other Diseases

The purpose of this section of the Communicable Disease Manual is to provide guidelines for several types of diseases and conditions of Public Health concern:

- Common illnesses that are not reportable but that occur frequently and for which Public Health is asked for information e.g. Hand, Foot and Mouth Disease, Head Lice;
- Illnesses that act as triggers for public health to investigate e.g. Acute Flaccid Paralysis as an indicator for Polio;
- Epidemic forms of other diseases e.g. increased frequency of diarrheal illness that triggers an outbreak investigation to rule out food or water contamination;
- Unusual clinical manifestations of a disease e.g. emerging pathogen such as SARS or MERS-CoV which both first presented as a severe respiratory infection for which no known pathogen was identified.

## 11.1.1 Acute Flaccid Paralysis (AFP)

| Condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Acute Flaccid Paralysis (AFP)                                                                                                                                                                                                                                                                                                                                                                           |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Acute Flaccid Paralysis (AFP) is a broad clinical syndrome, typically characterized by rapid onset weakness, which may include respiratory and bulbar weakness. AFP may be the result of infectious or non-infectious agents. Polio can cause this clinical picture.</p> <p>This condition is reportable to the Chief Medical Officer of Health (CMOH), who will ensure that polio is ruled out.</p> |

| <b>Infectious Agent</b>      | Fifth disease is caused by parvovirus B19.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Clinical Presentation</b> | <p>Infection usually begins with mild flu-like symptoms (headache, mild fever, fatigue), followed by a “slapped cheek” rash several days later. After 1 to 4 days, the rash becomes confluent giving a lacy appearance on the rest of the body. The rash may be itchy and worsens with exposure to heat (such as bathing) or sunlight. It may come and go for weeks or months.</p> <p>In adults (especially women) the illness may be more severe and include joint pain affecting the wrists, ankles and knees which can persist for months. Adults may not have the rash.</p> <p>Approximately 20 to 25% of those infected have mild symptoms or are asymptomatic.</p> <p>Fifth disease is usually mild for children and adults who are otherwise healthy, but for some people, fifth disease can cause serious health complications. They include:</p> <ul style="list-style-type: none"> <li>• Individuals with chronic hemolytic anemias (e.g., sickle cell disease)</li> <li>• Individuals with weakened immune systems</li> <li>• Pregnant women, who can pass the infection to the developing fetus.</li> </ul> <p>Pregnant women who are not immune usually do not have serious complications after exposure to someone infected with fifth disease. If a pregnant woman is infected, illness is usually mild and there is usually no risk to the fetus. However in rare situations, an infected woman can pass the infection to the fetus, anemia in the fetus develops and a miscarriage occurs. The highest risk is in the first twenty weeks of pregnancy.</p> |
| <b>Diagnostics</b>           | <p>Fifth disease can often be diagnosed just by seeing the “slapped cheek” rash on a patient’s face. Diagnosis is usually clinical but infection or immunity can be laboratory confirmed by serologic tests, if required.</p> <p>Follow your Regional laboratory procedures for serologic testing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Treatment</b>             | Treatment is generally supportive. Most people infected recover completely without treatment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Communicability</b>                                    | Most communicable in the 7 to 10 day prodrome before the onset of rash. Once rash develops the individual is likely no longer infectious.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Susceptibility and Resistance</b>                      | Susceptibility is general, more common in young children. Infection is believed to confer lifelong immunity. Approximately 50 to 65% of adults are estimated to be immune to fifth disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

People may carry these bacteria and have no symptoms of illness. When they do cause illness, it may present in one of two forms:</p> <ul style="list-style-type: none"> <li>• Invasive GAS infection (please refer to <b>Section 7.3</b>); or</li> <li>• Non-invasive GAS infection</li> </ul> <p>Common non-invasive GAS infections include strep throat, scarlet fever, impetigo, and ear infections. These infections are less severe and more contagious than invasive GAS infections.</p> <p>Early signs of non-invasive GAS infection include sore throat, fever, rash or a skin infection that is red, swollen, warm and tender to touch.</p> <p>Very few of those who come in contact with the GAS bacteria will develop an invasive infection.</p> <p>Clients can help stop the spread of GAS infections by practicing hand hygiene (with an alcohol based hand rub and soap and water) after coughing or sneezing and before preparing foods or eating. Coughs and sneezes should be covered.</p> <p>This condition is not reportable to the Chief Medical Officer of Health (CMOH).</p> |

| <b>Infectious Agent</b>              | Coxsackievirus group A, an enterovirus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Clinical</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Clinical Presentation</b>         | <p>Usually begins with a fever, poor appetite, malaise and sore throat. One or 2 days after onset of fever, painful sores usually develop in the mouth (herpangina), beginning as small red spots that blister and that often become ulcers. The sores are often in the back of the mouth. A skin rash develops over 1 to 2 days. The rash has flat or raised red spots, sometimes with blisters. The rash is usually on the palms of the hands and soles of the feet; it may also appear on the knees, elbows, buttocks or genital area.</p> <p>Some people, especially young children, may get dehydrated if they are not able to swallow enough liquids because of painful mouth sores.</p> <p>Persons infected may not develop all symptoms; some may only get mouth sores or skin rash.</p> |
| <b>Diagnostics</b>                   | Diagnosis is usually clinical but can be laboratory confirmed by culture or serologic tests, if required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Treatment</b>                     | <p>Treatment is generally supportive. Care at home to help relieve symptoms can include:</p> <ul style="list-style-type: none"> <li>• Ample cool fluids to help relieve the sore throat. Cold foods such as flavoured ice pops and ice cream also may help.</li> <li>• Avoid acidic or spicy foods and drinks, such as salsa or orange juice. These foods can aggravate mouth sores.</li> <li>• Use of mouthwashes or sprays that numb mouth pain.</li> <li>• Use of acetaminophen (such as Tylenol) or ibuprofen (such as Advil) for pain and fever. Avoid the use of ASA (such as Aspirin) in children, as it has been linked to Reye syndrome.</li> </ul>                                                                                                                                     |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Occurrence</b>                    | Worldwide. Occurs most often in the summer and early fall.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Reservoir</b>                     | Humans.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Transmission</b>                  | Direct contact with nose and throat secretions and feces of infected persons (who may be asymptomatic) and by aerosol droplet spread.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Incubation Period</b>             | Usually 3 to 5 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Communicability</b>               | During the acute stage of illness and perhaps longer, as the virus persists in the stool for several weeks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Susceptibility and Resistance</b> | Susceptibility is universal. Immunity to the specific virus is possibly acquired through clinical or unapparent infection; duration unknown.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

HUS mainly affects infants and young children. Cases may be preceded by an episode of infectious, sometimes bloody, diarrhea acquired as a foodborne illness or from a contaminated water supply and caused by E. coli 0157:H7, although Shigella, Campylobacter and a variety of viruses have also been implicated.</p> <p>This condition is reportable to the Chief Medical Officer of Health (CMOH), who will begin an immediate investigation in order to identify the cause (if unknown) and determine if there are other cases.</p> |

| <b>Infectious Agent</b>      | <p>Lice are parasitic insects that survive by feeding on human blood. There are three different types of lice that live on humans, each preferring a different area of the body. They are:</p> <ul style="list-style-type: none"> <li>• <i>Pediculus humanus capitis</i> (head louse),</li> <li>• <i>Pediculus humanus corporis</i> (body louse, clothes louse), and</li> <li>• <i>Phthirus pubis</i> ("crab" louse, pubic louse).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Clinical Presentation</b> | <p><u>Head lice:</u><br/>Head lice infestations can be asymptomatic. Itching ("pruritus") is the most common symptom of head lice infestation and is caused by an allergic reaction to the bites. It may take 4–6 weeks for itching to appear the first time a person has head lice. Other symptoms may include:</p> <ul style="list-style-type: none"> <li>• A tickling feeling on the scalp or a sensation of something moving in the hair;</li> <li>• Irritability and sleeplessness; and</li> <li>• Sores on the head caused by scratching. These sores caused by scratching can sometimes become infected with bacteria normally found on a person's skin.</li> </ul> <p>Head lice are not known to transmit any disease and therefore are not considered a health hazard.</p> <p><u>Body lice:</u><br/>Intense itching and rash caused by an allergic reaction to the bites are common symptoms of body lice infestation. Intense itching leads to scratching which can cause sores and secondary bacterial infection of the skin.</p> <ul style="list-style-type: none"> <li>• When body lice infestation is long lasting, heavily bitten areas of the skin can become thickened and darkened, particularly in the mid-section of the body. This condition is called "vagabond's disease."</li> <li>• Only the body louse is known to spread disease (epidemic typhus, trench fever, and epidemic relapsing fever).</li> </ul> <p><u>Pubic lice:</u><br/>Itching ("pruritus") in the pubic and groin area is the most common symptom of pubic lice infestation. Intense itching leads to scratching which can cause sores and secondary bacterial infection of the skin.</p> <ul style="list-style-type: none"> <li>• Visible lice eggs ("nits") or lice crawling or attached to pubic hair, or less commonly other hairy areas of the body (eyelashes, eyebrows, beard, mustache, armpits, chest, back) are other signs of pubic lice infestation.</li> <li>• Pubic lice on the head (eyelashes or eyebrows) of a child may be an indication of sexual exposure or abuse.</li> <li>• Pubic lice are not known to transmit any disease. Persons infested with pubic lice should be evaluated for other sexually transmitted diseases (STIs).</li> </ul> |
| <b>Diagnostics</b>           | <p><u>Head lice:</u><br/>The diagnosis of head lice infestation is best made by finding a live nymph or adult louse on the scalp or hair of a person.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | <ul style="list-style-type: none"> <li>• Because adult and nymph lice are very small, move quickly, and avoid light, they may be difficult to find. The use of a fine-toothed lice comb or magnifying glass may assist with the identification of live lice.</li> <li>• If crawling lice are not seen, finding nits attached firmly within ¼ inch of the base of hair shafts suggests, but does not confirm, the person is infested.</li> <li>• Nits are frequently seen on hair behind the ears and near the back of the neck.</li> <li>• Nits that are attached more than ¼ inch from the base of the hair shaft are almost always non-viable (hatched or dead).</li> <li>• If no nymphs or adults are seen, and the only nits found are more than ¼ inch from the scalp, then the infestation is probably old and no longer active, and does not need to be treated.</li> <li>• Nits may be confused with other particles found in hair such as dandruff, hair spray droplets, and dirt particles.</li> </ul> <p><u>Body lice:</u><br/>Body lice infestation is diagnosed by finding eggs and crawling lice in the seams of clothing. Sometimes a body louse can be seen crawling or feeding on the skin. Although body lice and nits can be large enough to be seen with the naked eye, a magnifying lens may be necessary to find crawling lice or eggs.</p> <p><u>Pubic lice:</u><br/>Pubic lice infestation is diagnosed by finding a “crab” louse or eggs on hair in the pubic region or, less commonly, elsewhere on the body (such as the eyebrows, eyelashes, beard, mustache, armpit, perianal area, groin, trunk and/or scalp). Although pubic lice and nits can be large enough to be seen with the naked eye, a magnifying lens may be necessary to find lice or eggs.</p>                                                                                                               |
| Treatment | <p>Non-pharmacological measures may also be used in combination with the treatments described below to control a lice infestation. For example, hats, scarves, pillow cases, bedding, clothing, and towels worn or used by the infested person in the 2-day period just before treatment is started can be machine washed and dried using the hot water and hot air cycles because lice and eggs are killed by exposure for 5 minutes to temperatures greater than 53.5°C (128.3°F). Items that cannot be laundered may be dry-cleaned or sealed in a plastic bag for two weeks. Items such as hats, grooming aids, and towels that come in contact with the hair of an infested person should not be shared. Vacuuming furniture and floors can remove an infested person's hairs that might have viable nits attached.</p> <ul style="list-style-type: none"> <li>• Nix (permethrin 1%) cream rinse is the first line treatment <b>for all infestations</b>. Other treatments include RESULTZ (Isopropyl Myristate 50% solution) and R &amp; C (Piperonyl Butoxide, Pyrethrins) 3% and 0.3% Shampoo. These medications are safe and effective when used exactly according to the instructions in the package or on the label.</li> </ul> <p><u>Head lice:</u></p> <ul style="list-style-type: none"> <li>• Treatment for head lice is recommended for persons diagnosed with an active infestation. All household members and other close contacts should be checked; those persons with evidence of an active infestation should be treated. All infested persons (household members and close contacts) and their bedmates should be treated at the same time.</li> <li>• Retreatment of head lice usually is recommended because no approved treatment is completely ovicidal (i.e. do not kill all the egg stages). The retreatment schedule can vary depending on the treatment used.</li> </ul> |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                     | <ul style="list-style-type: none"> <li>• Removal of all nits after successful treatment with a pediculicide is not necessary to prevent further spread. Removal of nits after treatment may be done for aesthetic reasons, or to reduce diagnostic confusion and the chance of unnecessary retreatment. Because pediculicides are not 100% ovicidal, some experts recommend the manual removal of nits that are attached within ¼ inch of the base of the hair shaft.</li> <li>• Treatments for head lice are generally safe and effective when used correctly. Some treatments may cause an itching or a mild burning sensation caused by inflammation of the skin on the scalp. All medicines used for the treatment of lice should be used with care and only as directed.</li> </ul> <p><u>Body lice:</u></p> <ul style="list-style-type: none"> <li>• A body lice infestation is treated by improving the personal hygiene of the infested person, including assuring a regular (at least weekly) change of clean clothes. Clothing, bedding, and towels used by the infested person should be laundered using hot water (at least 130°F) and machine dried using the hot cycle.</li> <li>• Sometimes the infested person also is treated with a pediculicide; however, a pediculicide generally is not necessary if hygiene is maintained and items are laundered appropriately at least once a week. A pediculicide should be applied exactly as directed on the bottle or by your physician.</li> <li>• If you choose to treat, guidelines for the choice of the pediculicide are the same as for head lice.</li> </ul> <p><u>Pubic lice:</u></p> <ul style="list-style-type: none"> <li>• Following treatment, most nits will still be attached to hair shafts. Nits may be removed with fingernails or by using a fine-toothed comb.</li> <li>• Put on clean underwear and clothing after treatment.</li> <li>• Repeat treatment in 9–10 days if live lice are still found.</li> <li>• Special instructions for treatment of lice and nits found on eyebrows or eyelashes: <ul style="list-style-type: none"> <li>o If only a few live lice and nits are present, it may be possible to remove these with fingernails or a nit comb.</li> <li>o If additional treatment is needed for lice or nits on the eyelashes, careful application of ophthalmic-grade petrolatum ointment (only available by prescription - available in tear gel formulation from the health center) to the eyelid margins 2–4 times a day for 10 days is effective. Regular Vaseline should <b>NOT</b> be used because it can irritate the eyes if applied.</li> </ul> </li> </ul> |
| <b>Pathogen</b>     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Occurrence</b>   | Worldwide. Outbreaks of head lice are common among children in schools and institutions everywhere. Body lice are prevalent among populations with inadequate personal hygiene, especially in cold climates where heavy clothing is worn and bathing is infrequent, or in situations when people cannot change clothes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Transmission</b> | <p><u>Head lice:</u></p> <p>Head lice are spread most commonly by direct head-to-head (hair-to-hair) contact. However, much less frequently they are spread by sharing clothing or belongings onto which lice have crawled or nits attached to shed hairs may have fallen. The risk of getting infested by a louse that has fallen onto a carpet or furniture is very small. Head lice survive less than 1–2 days if they fall off a person and cannot feed; nits cannot hatch and usually die within a week if they are not kept at the same temperature as that found close to the scalp.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                                      | <p><u>Body lice:</u><br/>Body lice are spread most commonly by direct contact with an infested person or an infested person's clothing or bedding.</p> <p><u>Pubic lice:</u><br/>Pubic lice most commonly are spread directly from person to person by sexual contact. Pubic lice very rarely may be spread by clothing, bedding, or a toilet seat.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Incubation Period</b>             | The life cycle of the louse has three stages: egg, nymph, and adult. Nits are lice eggs; they take about a week to hatch and become nymphs. Nymphs look like smaller versions of adult lice and become adults in about 7 days. Adult lice can live up to 30 days on a person. To live, adult lice need to feed on human blood several times daily. Without blood meals, the louse will die within 1 to 2 days off the host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Communicability</b>               | As long as lice or eggs remain viable on the infested person or on fomites.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Susceptibility and Resistance</b> | General; any person may become infested under suitable exposure conditions. Repeated infestations may occur.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Health Education</b>              | <p>The following are steps that can be taken to help prevent and control the spread of lice:</p> <p><u>Head lice:</u></p> <ul style="list-style-type: none"> <li>Avoid head-to-head (hair-to-hair) contact during play and other activities at home, school, and elsewhere (sports activities, playground, slumber parties, and/or camp).</li> <li>Do not share clothing such as hats, scarves, coats, sports uniforms, hair ribbons, or barrettes.</li> <li>Do not share combs, brushes, or towels. Disinfest combs and brushes used by an infested person by soaking them in hot water (at least 130°F) for 5–10 minutes.</li> <li>Do not lie on beds, couches, pillows, carpets, or stuffed animals that have recently been in contact with an infested person.</li> <li>Machine wash and dry clothing, bed linens, and other items that an infested person wore or used during the 2 days before treatment using the hot water (130°F) laundry cycle and the high heat drying cycle. Clothing and items that are not washable can be dry-cleaned OR sealed in a plastic bag and stored for 2 weeks.</li> </ul> |

| <b>Infectious Agent</b>              | <i>Roseola infantum</i> is an infection of infants or very young children caused by human herpesvirus 6 (HHV-6) or, less commonly, HHV-7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Clinical</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Clinical Presentation</b>         | <p>Fever of 39.5 to 40.5° C begins abruptly and persists 3 to 5 days without any localizing symptoms or signs. Despite the high fever, the child is usually alert and active, although febrile seizures may occur. Cervical and posterior auricular lymphadenopathy often develops. Encephalitis or hepatitis occurs rarely.</p> <p>The fever usually falls rapidly on the 4th day, and when the fall occurs, a macular or maculopapular exanthem usually appears prominently on the chest and abdomen and, to a lesser extent, on the face and extremities; it lasts for a few hours to 2 days and may be unnoticed in mild cases. In 70% of HHV-6 infections, the classic exanthem does not occur.</p> <p>One of the key features of roseola is that the rash appears after the fever has ended. In most other childhood illnesses, the fever and the rash happen at the same time.</p> |
| <b>Diagnostics</b>                   | Roseola may be suspected when a child aged 6 mo to 3 yr develops typical symptoms and signs. Diagnosis is usually clinical but can be laboratory confirmed by culture or serologic tests, if required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Treatment</b>                     | Treatment is generally supportive. Most children recover fully from roseola within a week of the onset of the fever.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Occurrence</b>                    | Worldwide. Occurs most often in the spring and fall.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Reservoir</b>                     | Humans.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Transmission</b>                  | The exact mode of transmission is unknown, but droplet spread of respiratory secretions is believed to play a role.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Incubation Period</b>             | Usually 5 to 15 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Communicability</b>               | Unknown; communicability likely greatest during the febrile stage of the illness.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Susceptibility and Resistance</b> | Susceptibility is general. Infection is believed to confer lifelong immunity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Infectious Agent</b>      | Human scabies is caused by an infestation of the skin by the human itch mite ( <i>Sarcoptes scabiei</i> var. <i>hominis</i> ). The microscopic scabies mite burrows into the upper layer of the skin where it lives and lays its eggs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Clinical Presentation</b> | <p>The most common symptoms of scabies, itching and a skin rash, are caused by sensitization (a type of “allergic” reaction) to the proteins and feces of the parasite. Severe itching (pruritus), especially at night, is the earliest and most common symptom of scabies. A pimple-like (papular) itchy (pruritic) “scabies rash” is also common. Rashes appear more commonly in the webs between the fingers, the insides of the wrists and elbows, the breasts, the male genitals, the belt line, the back and the buttocks. Infants may have a rash on the head, neck, palms or soles.</p> <p>Tiny burrows are sometimes seen on the skin; these are caused by the female scabies mite tunneling just beneath the surface of the skin. These burrows appear as tiny raised and crooked (serpiginous) grayish-white or skin-colored lines on the skin surface. Because mites are often few in number (only 10-15 mites per person), these burrows may be difficult to find. They are found most often in the webbing between the fingers, in the skin folds on the wrist, elbow, or knee, and on the penis, breast, or shoulder blades.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Diagnostics</b>           | Diagnosis may be established by recovery from a burrow and microscopic identification of the mite, eggs or mite feces (scybala).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Treatment</b>             | <p>Products used to kill scabies mites are called <i>scabicides</i>. There are no non-prescription products approved to treat human scabies.</p> <p>The following medications for the treatment of scabies are available only by prescription or at Community Health Centers:</p> <ul style="list-style-type: none"> <li>• <u>Permethrin cream 5% (Nix)</u><br/>Permethrin is safe and effective when used as directed. Permethrin kills the scabies mite and eggs. Permethrin is the drug of choice for the treatment of scabies. Two (or more) applications, each about a week apart, may be necessary to eliminate all mites.</li> <li>• <u>Crotamiton lotion 10% and Crotamiton cream 10%</u><br/>Frequent treatment failure has been reported with crotamiton in the United States.</li> </ul> <p>Bedding, clothing, and towels used by infested persons or their household, sexual, and close contacts anytime during the three days before treatment should be washed in hot water and dried in a hot dryer, by dry-cleaning, or by sealing in a plastic bag for at least 72 hours. Scabies mites generally do not survive more than 2 to 3 days away from human skin.</p> <p>Because the symptoms of scabies are due to a hypersensitivity reaction (allergy) to mites and their feces (scybala), itching still may continue for several weeks after treatment even if all the mites and eggs are killed. If itching still is present more than 2 to 4 weeks after treatment or if new burrows or pimple-like rash lesions continue to appear, retreatment may be necessary.</p> <p>Skin sores that become infected should be treated with an appropriate antibiotic.</p> |

| <b>Occurrence</b>                    | <b>Worldwide:</b> Scabies can affect people of all social classes and all standards of personal hygiene. Scabies can spread rapidly under crowded conditions where close body contact is frequent. Institutions such as nursing homes, extended-care facilities, and prisons are often sites of scabies outbreaks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Reservoir</b>                     | Humans.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Transmission</b>                  | The scabies mite usually is spread by direct, prolonged, skin-to-skin contact with a person who has scabies. Transmission from undergarments and bedding occurs only if these have been contaminated by infested persons immediately beforehand. Mites can burrow beneath the skin surface in about 1 hour.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Incubation Period</b>             | Two to 6 weeks in persons without previous exposure; persons who have been previously infested develop symptoms 1 to 4 days after exposure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Communicability</b>               | Until mites and eggs are destroyed by treatment, usually after 1 or 2 courses of treatment a week apart.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Susceptibility and Resistance</b> | Some resistance is suggested; fewer mites succeed in establishing themselves on persons previously infested than those with no prior exposure. Immunocompromised persons are susceptible to hyperinfestation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 11.10 Epidemic Forms of Other Diseases

| Condition                                                                           | Epidemic Forms of Other Diseases                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                     | <p>Although not all diseases are reportable to the CMOH, there are always public health concerns when any disease occurs more frequently than expected. If any illness or condition is occurring in an unusual amount, in a specific location, or has been linked with a specific activity; these are considered to be “reportable” and should be immediately reported to your RCDC, and in turn reported to the Office of the Chief Medical Officer of Health.</p> |
| Approval                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Approved by Dr. Maureen Baikie, Chief Medical Officer of Health, September 17, 2015 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 11.11 Unusual Clinical Manifestations of Disease

| Condition                                                                           | Unusual Clinical Manifestations of Disease                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                     | <p>There are always new pathogens emerging, and known pathogens can always mutate and cause changes in clinical manifestations. For these reasons, it is important to report any unusual clinical manifestation with possible infectious cause (e.g. severe bloody diarrhea, severe respiratory illness) to your RCDC so that proper follow-up, outbreak investigation and management may be initiated as soon as possible, if deemed necessary.</p> |
| <b>Approval</b>                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### REPORTING CLINICIAN

Reporter Name: \_\_\_\_\_

Report Date: \_\_\_\_\_

Contact Information: \_\_\_\_\_

**Fill in OR affix CASE addressograph here**

**Last Name:** \_\_\_\_\_

**First Name:** \_\_\_\_\_

**Sex:**      ☐ **Male**      ☐ **Female**

**Date of Birth:** \_\_\_\_\_(DD) \_\_\_\_\_(month) \_\_\_\_\_(YYYY)

**Chart#:** \_\_\_\_\_

**Health Card #:** \_\_\_\_\_

**Community of Residence:** \_\_\_\_\_

If consultation is required send completed form to the Regional CDC

1. Exposure date: \_\_\_\_\_ (dd) \_\_\_\_\_ (month) \_\_\_\_\_ (yyyy)
2. Is the *Exposed* a health care worker or exposed through the nature of their work? ☐ Yes ☐ No  
If yes, specify: \_\_\_\_\_
- Was Workers' Safety and Compensation Commission notified? ☐ Yes ☐ No
3. **What was the nature of the injury?**  
☐ Parenteral ☐ Splash to mucous membranes of eyes, nose or mouth  
☐ Human bite ☐ Other, specify: \_\_\_\_\_  
☐ Non-intact skin exposure
4. **What type of body fluid was involved?**  
☐ Blood/blood products  
☐ Other body fluid, specify: \_\_\_\_\_  
Was the body fluid visibly contaminated with blood? ☐ Yes ☐ No ☐ Unknown
5. **Information on the *EXPOSED*:**
- a. **Did the Exposed consent to testing?** ☐ Yes ☐ No ☐ Unknown
- b. **What is the status of the *Exposed* with respect to tetanus vaccine?**  
☐ Unvaccinated  
☐ Vaccinated: Date of most recent vaccination \_\_\_\_\_
- c. **Is the Exposed known to have:**  
**Hepatitis B** ☐ Yes ☐ No ☐ Unknown  
**Hepatitis C** ☐ Yes ☐ No ☐ Unknown  
**HIV** ☐ Yes ☐ No ☐ Unknown
- d. **What is the status of the *Exposed* with respect to hepatitis B vaccine?**  
☐ Unvaccinated  
☐ Vaccinated Date: \_\_\_\_\_  
Number of Doses: ☐ 1 ☐ 2 ☐ 3  
Responder status: ☐ known responder  
☐ response unknown ☐ non-responder  
☐ Unknown  
☐ Other, specify: \_\_\_\_\_

e. **Results from BASELINE BLOOD TEST on the Exposed:**

| Test         | Known positive or protective antibody level               | Date collected (dd-mm-yyyy) | Result (titre level) | Comments |
|--------------|-----------------------------------------------------------|-----------------------------|----------------------|----------|
| HBsAg        | <input type="checkbox"/> Yes* <input type="checkbox"/> No | - -                         |                      |          |
| Anti-HBs     | <input type="checkbox"/> Yes* <input type="checkbox"/> No | - -                         |                      |          |
| Anti-HCV     | <input type="checkbox"/> Yes* <input type="checkbox"/> No | - -                         |                      |          |
| HIV antibody | <input type="checkbox"/> Yes* <input type="checkbox"/> No | - -                         |                      |          |

\*Do not retest (HBsAg = Hepatitis B Surface Antigen, Anti-HBS = Hepatitis B Surface Antibody)

6. **Information on the SOURCE:**

a. **Is the Source known?** ☐ Yes ☐ No

b. **What is known of the status of the Source with respect to:**

| Test         | Known status                                              | Most recent test date (dd-mm-yyyy) | Result | Unknown                  | Comments |
|--------------|-----------------------------------------------------------|------------------------------------|--------|--------------------------|----------|
| HBsAg        | <input type="checkbox"/> Yes* <input type="checkbox"/> No | - -                                |        | <input type="checkbox"/> |          |
| Anti-HBs     | <input type="checkbox"/> Yes* <input type="checkbox"/> No | - -                                |        | <input type="checkbox"/> |          |
| Anti-HCV     | <input type="checkbox"/> Yes* <input type="checkbox"/> No | - -                                |        | <input type="checkbox"/> |          |
| HIV antibody | <input type="checkbox"/> Yes* <input type="checkbox"/> No | - -                                |        | <input type="checkbox"/> |          |

\*Do not retest

c. **Does the Source have any of the following risk factors?**

|                                 | Yes                      | No                       | Refused                  | Unknown                  | Comments |
|---------------------------------|--------------------------|--------------------------|--------------------------|--------------------------|----------|
| From an HBV endemic region      | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |          |
| Multiple sexual partners        | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |          |
| Partner HBV positive or at risk | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |          |
| HBV positive household contact  | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |          |
| Injection drug use              | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |          |
| Tattoos or piercings            | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |          |
| Other, specify:                 |                          |                          |                          |                          |          |

d. **Did the Source consent to testing?** ☐ Yes ☐ No ☐ Unknown

e. **Source results from current episode:**

| Test         | Known positive or protective antibody level               | Date collected (dd-mm-yyyy) | Result | Comments |
|--------------|-----------------------------------------------------------|-----------------------------|--------|----------|
| HBsAg        | <input type="checkbox"/> Yes* <input type="checkbox"/> No | - -                         |        |          |
| Anti-HBs     | <input type="checkbox"/> Yes* <input type="checkbox"/> No | - -                         |        |          |
| Anti-HCV     | <input type="checkbox"/> Yes* <input type="checkbox"/> No | - -                         |        |          |
| HIV antibody | <input type="checkbox"/> Yes* <input type="checkbox"/> No | - -                         |        |          |

\*Do not retest

7. **If the BC Center of Excellence in HIV/AIDS was consulted what were their recommendations?**  
*Note this consultation is required in order to access HIV PEP*

8. **If the CMOH/DCMOH was consulted what were their recommendations?**

| STI       | Stage (syphilis only) | Length of time for contact tracing                                       |
|-----------|-----------------------|--------------------------------------------------------------------------|
| Chlamydia | -                     | 60 days                                                                  |
| Gonorrhea | -                     | 60 days                                                                  |
| Chancroid | -                     | 2 weeks prior to symptom onset                                           |
| Syphilis* | Primary               | 3 months prior to symptom onset                                          |
|           | Secondary             | 6 months prior to symptom onset                                          |
|           | Early latent          | 1 year prior to diagnosis                                                |
|           | Late latent           | Assess marital or long-term partners & children                          |
|           | Congenital            | Assess mother & her sexual partner(s)                                    |
|           | Stage undetermined    | Assess in consultation with colleague experienced in syphilis management |

**Contact Information:**

Fill in OR affix individual label here

First Name:

**Sex:** ☐ Male ☐ Female

**Date of Birth:** \_\_\_\_\_ (DD) \_\_\_\_\_ (month) \_\_\_\_\_ (YYYY)

Chart#:

**Health Card #:** \_\_\_\_\_

Community of Residence: \_\_\_\_\_

**Notes:** Check one treatment in above table as relevant and fill in date given. Partner identification and treatment prevents re-infection.

*Sexually Transmitted Infection (STI) Contact Investigation* Form completed ☐ Yes ☐ No

REPORTING CLINICIAN

Reporter Name: \_\_\_\_\_ Contact Information: \_\_\_\_\_ Report Date \_\_\_\_\_

**Fax completed form to the Regional CDC within 24 hours, update as necessary:**

- o Baffin: (867) 975-4833
- o Kitikmeot: (867) 983-4088
- o Kivalliq: (867) 645-8272

## SYPHILIS ASSESSMENT REPORT FORM

For use by front line health care providers; please fax to RCDC

Date of Assessment (DDMMYY): \_\_\_\_\_ - \_\_\_\_\_ - \_\_\_\_\_

Case ID: (assign after lab-confirmation) \_\_\_\_\_

Please fill in OR addressograph/affix label

Last Name: \_\_\_\_\_

First Name: \_\_\_\_\_

Sex: ☐ Male ☐ Female ☐ Other

Date of Birth: \_\_\_\_\_ (DD) \_\_\_\_\_ (month) \_\_\_\_\_ (YYYY)

Chart#: \_\_\_\_\_

Health Card #: \_\_\_\_\_

Community of Residence: \_\_\_\_\_

### BOX 1.1 - DEMOGRAPHIC INFORMATION

Ethnicity (check **one** box only, unless specified)

☐ Canadian Inuit ☐ Canadian Non-Aboriginal ☐ Foreign-born (specify country): \_\_\_\_\_

☐ Canadian Métis ☐ Other Canadian Aboriginal (specify): \_\_\_\_\_

Communities lived in the past year (specify all): \_\_\_\_\_

Reporting community: \_\_\_\_\_

If visiting Nunavut, place of residency: \_\_\_\_\_

### BOX 1.2 - REASON FOR TESTING

☐ Symptomatic of syphilis

☐ Contact of a case

☐ Prenatal screen

☐ STI screen

☐ Other routine screen (including pap smear)

☐ Other (specify): \_\_\_\_\_

### BOX 1.3 - CLINICAL HISTORY

Previous Syphilis diagnosis?

☐ Yes Year(s) of previous diagnosis: \_\_\_\_\_ ☐ No ☐ Unknown

Stage of previous diagnosis: \_\_\_\_\_

Date of last serology: \_\_\_\_\_ - \_\_\_\_\_ - \_\_\_\_\_

Pregnant: ☐ Yes (due date : \_\_\_\_\_ - \_\_\_\_\_ - \_\_\_\_\_) ☐ No ☐ Unknown

Date of most recent possible exposure: \_\_\_\_\_ - \_\_\_\_\_ - \_\_\_\_\_

### BOX 1.4 - TRAVEL

Travel 12 months prior to diagnosis:

☐ Yes ☐ No ☐ Unknown

Sexual contact during travel:

☐ Yes ☐ No ☐ Unknown

If Yes, **specify communities**: \_\_\_\_\_

### BOX 1.5 - SIGNS AND SYMPTOMS

Physical exam done: ☐ Yes ☐ No ☐ Unknown

| Typical Stage | Symptom                                              | Onset date (specify date if known) |                          |

### BOX 1.6 - RISK FACTORS

Risk factors in the 12 months prior to diagnosis:

Exchange of sex for money/drugs ☐ Yes ☐ No

Been in jail/juvenile detention ☐ Yes ☐ No

Injection drug user (IDU) ☐ Yes ☐ No

Sex with IDU ☐ Yes ☐ No

Men who have sex with men ☐ Yes ☐ No

Sex without a condom ☐ Yes ☐ No

Multiple sex partners ☐ Yes ☐ No

History of other STI ☐ Yes ☐ No

Use of alcohol or drugs ☐ Yes ☐ No

Under-housed/unstable housing ☐ Yes ☐ No

### BOX 1.7 INITIAL TESTING - all lab results must be sent to RCDC

| Date Blood drawn      | Test                                  | Result: check one box, update as necessary |                                   |                                  |                                        |

# Vaccine Preventable Disease Report Form

## DISEASE

☐ Diphtheria    ☐ Measles    ☐ Mumps    ☐ Pertussis    ☐ Poliomyelitis    ☐ Rubella    ☐ Tetanus    ☐ Varicella

## DIAGNOSIS

- ☐ Lab-confirmed case (Clinical illness + lab confirmation)
- ☐ Clinically-confirmed case (Clinical illness + link to known case)
- ☐ Probable case (Clinical illness only)

### BOX 1.1 – DEMOGRAPHIC INFORMATION

**Origin:** ☐ Inuit ☐ Other Canadian Aboriginal (*specify*): \_\_\_\_\_ ☐ Canadian Non-Aboriginal  
☐ Foreign-born (*specify country of birth*): \_\_\_\_\_

**Case Factors:**    ☐ Healthcare worker    ☐ Attends childcare, school, *specify:* \_\_\_\_\_

**Travel within or outside territory within the last month prior to diagnosis:** ☐ Yes ☐ No ☐ Unknown  
If yes, *specify*

### BOX 1.2 – LABORATORY TESTING

Date of collection (dd-mm-yyyy): \_\_\_\_\_

Type of specimen (eg. swab, blood): \_\_\_\_\_

Result if available: \_\_\_\_\_

### BOX 1.3 – CLINICAL INFORMATION

Onset date of first symptoms (dd-mm-yyyy):

Symptoms (*specify*): \_\_\_\_\_

#### BOX 1.4 – IMMUNIZATION HISTORY FOR DISEASE BEING REPORTED

☐ None      ☐ Unknown

| Vaccine Name | Date received (dd-mm-yyyy) |
|--------------|----------------------------|
|              |                            |
|              |                            |
|              |                            |
|              |                            |
|              |                            |

**BOX 1.5 - TREATMENT INITIATED (if applicable)**

☐ None

| Treatment Given | Date (dd-mm-yyyy) |
|-----------------|-------------------|
|                 |                   |
|                 |                   |
|                 |                   |
|                 |                   |
|                 |                   |

## Animal Incident Report Form

CASE #

Fill in OR affix addressograph here

Last Name: \_\_\_\_\_

First Name: \_\_\_\_\_

Sex: ☐ Male ☐ Female ☐ Other

Date of Birth: \_\_\_\_ (DD) \_\_\_\_ (month) \_\_\_\_ (YYYY)

Chart#: \_\_\_\_\_

Health Card #: \_\_\_\_\_

Community of Residence: \_\_\_\_\_

### STEP 1: INCIDENT DETAILS: Report IMMEDIATELY to Environmental Health (contact below)

Date Reported: DD/MM/YYYY \_\_\_\_\_

Date of Incident: DD/MM/YY \_\_\_\_\_

Details of Incident: \_\_\_\_\_

Nature of Exposure: ☐ Bite ☐ Scratch ☐ Saliva on intact skin ☐ Handling

☐ Saliva on existing lesion ☐ Saliva on mucous membrane

Description of wounds: ☐ Abrasion ☐ Laceration ☐ Avulsion ☐ Puncture

Skin broken: Yes ☐ No ☐

Nurse/Physician: \_\_\_\_\_ Phone: \_\_\_\_\_

Patient contact: Phone: \_\_\_\_\_

### STEP 2: ANIMAL INFORMATION

Owner: \_\_\_\_\_ Phone Home \_\_\_\_\_ Other \_\_\_\_\_

If applicable, address: \_\_\_\_\_

Animal Species: Dog ☐ Cat ☐ Fox ☐ Other ☐ \_\_\_\_\_ Breed or Description: \_\_\_\_\_

Bite: provoked ☐ unprovoked ☐ Animal behavior: Normal ☐ Abnormal ☐ Animal: Stray ☐ Home owned ☐

Current animal location: \_\_\_\_\_

Animal vaccinated: Yes ☐ No ☐ By whom: Vet ☐ Lay Vaccinator ☐ Proof Provided Yes ☐ No ☐
