

# Nunavut Communicable Disease and Surveillance Manual

## Contents

### **1.0 Introduction**

### **2.0 Public Health Investigation, Management and Reporting of Communicable Diseases and Outbreaks in Nunavut**

- 2.1 Legislative Authority
- 2.2 Communicable Disease Surveillance and Follow-up

### **3.0 Outbreak Management Guidelines**

- 3.1 Principles of Outbreak Management
- 3.2 Outbreak Team
- 3.3 Roles and Responsibilities of Outbreak Team Members
- 3.4 Steps in Outbreak Investigation and Management

### **4.0 Enteric, Food, and Waterborne Infections**

- 4.1 Amoebiasis
- 4.2 Botulism
- 4.3 Campylobacteriosis
- 4.4 Cholera
- 4.5 Cryptosporidiosis
- 4.6 Cyclosporiasis
- 4.7 Giardiasis
- 4.8 Hepatitis A
- 4.9 Listeriosis
- 4.10 Norovirus
- 4.11 Paralytic Shellfish Poisoning
- 4.12 Paratyphoid
- 4.13 Salmonellosis
- 4.14 Shigellosis
- 4.15 Trichinosis
- 4.16 Typhoid
- 4.17 Verotoxigenic *Escherichia coli*
- 4.18 Yersiniosis

## **5.0 Blood-Borne Infections**

- 5.1 Acquired Immunodeficiency Syndrome and Human Immunodeficiency Virus Infection
- 5.2 Blood and Body Fluid Exposure
- 5.3 Hepatitis B
- 5.4 Hepatitis C
- 5.5 Human T-cell Lymphotropic Virus

## **6.0 Sexually Transmitted Infections**

- 6.1 Chancroid
- 6.2 Chlamydia
- 6.3 Gonorrhea
- 6.4 Syphilis

## **7.0 Vaccine Preventable Infections**

- 7.1 Diphtheria
- 7.2 Human Papillomavirus
- 7.3 Invasive *Haemophilus influenzae*
- 7.4 Disease Measles
- 7.5 Mumps
- 7.6 Pertussis
- 7.7 Poliomyelitis
- 7.8 Rubella
- 7.9 Rubella, Congenital
- 7.10 Smallpox
- 7.11 Tetanus
- 7.12 Varicella

## **8.0 Infections Spread By Direct Contact**

- 8.1 Group B Streptococcal Disease Methicillin-
- 8.2 Resistant *Staphylococcus aureus* Viral
- 8.3 Hemorrhagic Fevers
- 8.4 Clostridium Difficile

## **9.0 Infections Spread By Respiratory Routes**

- 9.1 Influenza
- 9.2 Invasive Group A Streptococcal
- 9.3 Disease Invasive Meningococcal
- 9.4 Disease Invasive Pneumococcal
- 9.5 Disease Legionellosis
- 9.6 Leprosy
- 9.7 Respiratory Syncytial Virus
- 9.8 Severe Acute Respiratory Syndrome

## **10.0 Vectorborne and Zoonotic Infections**

- 10.1 Anthrax
- 10.2 Brucellosis
- 10.3 Hantavirus Pulmonary Syndrome/Viral Disease
- 10.4 Lyme Disease
- 10.5 Malaria
- 10.6 Plague
- 10.7 Rabies
- 10.8 Tularemia
- 10.9 West Nile Virus
- 10.10 Yellow Fever

## **11.0 Other**

- 11.1 Acute Flaccid Paralysis
- 11.2 Bed bugs
- 11.3 Fifth Disease
- 11.4 Group A Streptococcal Disease (non-invasive)
- 11.5 Hand, Foot and Mouth Disease
- 11.6 Hemolytic Uremic Syndrome
- 11.7 Lice
- 11.8 Roseola
- 11.9 Scabies
- 11.10 Epidemic forms of other diseases
- 11.11 Unusual clinical manifestations of a disease that appears communicable

## **12.0 Forms**

- A. Communicable Diseases and Conditions Report Form
- B. Food and Waterborne Illness Investigation Form
- C. Blood-Borne Infections Contact Investigation Form
- D. Exposure to Blood and Body Fluids Case Report and Worksheet
- E. Hepatitis B Report Form
- F. Hepatitis C Report Form
- G. Sexually Transmitted Infection Contact Investigation Form
- H. Chlamydia and Gonorrhea Report Form
- I. Syphilis Assessment Report Form
- J. Syphilis Case Summary Review Form
- K. Vaccine Preventable Disease Report Form
- L. Vaccine Preventable Disease Contact Investigation Form
- M. Bacterial Diseases Surveillance Form *Haemophilus influenzae*
- N. Invasive *Haemophilus influenzae* Disease Contact Investigation Form
- O. Bacterial Diseases Surveillance Form *Streptococcus agalactiae* (Group B)
- P. Bacterial Diseases Surveillance Form *Streptococcus pyogenes* (Group A)
- Q. Invasive Group A Streptococcal disease (iGAS) Contact Investigation Form
- R. Bacterial Diseases Surveillance Form *Neisseria meningitidis*
- S. Bacterial Diseases Surveillance Form *Streptococcus pneumoniae*

# 1.0 Introduction to the Nunavut Communicable Disease and Surveillance Manual

## Purpose

The purpose of this document is to present the basic protocol for public health investigation, management and reporting of communicable diseases and outbreaks in Nunavut. It provides a quick snap shot of the steps involved and the roles and responsibilities at each level of the system, e.g. community, regional and territorial level.

The primary public health objective of investigation and management of communicable disease is to prevent transmission to others. This is done by early identification of cases through mandatory reporting of these diseases and careful public health follow-up of cases and contacts. The outbreak investigation and management protocols are activated when an unusual number of cases of a communicable disease occurs.

## Principles

A hardcopy of the Communicable Disease and Surveillance Manual is available in every community health centre and public health centre in Nunavut as well as Qikiqtani General Hospital. It is also accessible online at the Nunavut Department of Health website:

<http://www.gov.nu.ca/health>

As the practice of public health surveillance and disease management constantly evolves with new information, the documents included in this manual will be evergreen and updated as needed. The updated documents will be sent in hardcopy to the health centres and will be uploaded onto the Nunavut Department of Health website in a timely manner.

The diseases included in this Manual are categorized into the following sections:

- Enteric, Food and Waterborne
- Blood-Borne
- Sexually Transmitted
- Vaccine Preventable
- Direct Contact
- Respiratory
- Vectorborne and Zoonotic
- Other

Although some diseases may belong to more than one section, each disease has been categorized into only one section for ease of use. Each section includes public health directives and roles and responsibilities of public health staff, as well as public health protocols, report forms, fact sheets where applicable, and additional information if needed for each disease in the section.

## **2.0 Public Health Investigation, Management and Reporting of Communicable Diseases and Outbreaks in Nunavut**

### **2.1 Legislative Authority**

Communicable diseases are those that are listed in the Communicable Disease Regulations of the Public Health Act as diseases that a medical practitioner, nurse, laboratory, or dentist is required by law to report to the Chief Medical Officer of Health (CMOH). The list of communicable diseases in Nunavut can be found in Table 2.1. This list is currently being updated as part of the work on developing a new Public Health Act for Nunavut.

Reports (with non-identifiable information) are subsequently made to the Public Health Agency of Canada (PHAC) and the International Circumpolar Surveillance System (ICS) for the specific diseases established by agreements with PHAC and ICS.

The CMOH has significant authority under the Public Health Act to ensure that individuals with communicable diseases are followed up and advised to take steps to prevent transmission to others.

Individuals required to report cases of notifiable diseases and conditions must provide the office of the CMOH all relevant demographic, clinical, personal, and epidemiological details. The CMOH may also request any additional information (e.g. copies of class lists, absentee reports, daily logs, etc.) required to complete the necessary follow-up.

**Table 2.1 Reportable Diseases in Nunavut (as per the 1990 *Public Health Act*, amended January 6, 2000)**

| <b>Reportable Diseases in Nunavut</b><br><b>(as per the 1990 <i>Public Health Act</i>, amended January 6, 2000)</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## 2.2 Communicable Disease Surveillance and Follow-up

Below is a general protocol for the follow-up of communicable diseases. The specific protocols for each disease are included in the Communicable Disease and Surveillance Manual. Each level of the public health system has a role to play: community, regional and territorial level.

### Roles and Responsibilities

#### 1. Community Level

This follow up is done by the Community Health Nurse, Public Health Nurse, or physicians depending on the community. Regional staff are available for consultation and guidance. The CMOH or Deputy CMOH is consulted as appropriate. See Figure 1 for Public Health management of communicable disease cases.

- a) Report of a communicable disease is received by the CMOH delegate (Regional Communicable Disease Coordinator, Territorial Communicable Disease Coordinator, Deputy CMOH, or CMOH directly). Sources may include:
  - Health Care providers such as physicians, nurse practitioners, community health nurses and public health nurses
  - Laboratories both within and outside of the Territory
  - Public health authorities in other provinces and territories or at the federal level
- b) Review report to determine if it is a reportable disease and follow-up is required.
- c) Review case (chart review and interview if necessary) to determine:
  - a. If treatment was appropriate and the case was compliant.
  - b. If the case was educated about the disease and prevention measures.
  - c. Exclude the case from work or school if appropriate.
- d) Identify contacts (contact tracing depending on the disease) to:
  - a. Assess if exposure actually occurred.
  - b. Determine if the contact is susceptible to the communicable disease.
  - c. Determine if the contact is symptomatic.
  - d. Refer for clinical assessment as needed.
  - e. Educate about the disease, e.g. signs and symptoms and how it is transmitted.
  - f. Provide appropriate intervention depending on the disease, e.g. quarantine, provide antibiotic prophylaxis, immunize, etc.
- e) Once follow-up is complete the public health case report form is completed and sent to the regional level.

#### 2. Regional Level

Regional follow-up is done by either the Regional Communicable Disease Coordinator or the Environmental Health Officer depending on the disease (see specific disease protocol).

- a) Regional staff review the case report form to ensure public health follow-up is complete and the case is closed.
- b) Reports are forwarded to the territorial level as appropriate for the specific disease.

#### 3. Territorial Level

Only the information required for monitoring and surveillance is forwarded to the territorial level where it is used to monitor trends and produce reports. See the Reporting section below.

**Figure 1: Public Health Management of Communicable Disease Case**

## Surveillance and Reporting

### Communicable Disease

All reports of communicable diseases are assessed against the surveillance case definition before being included in the case counts for Nunavut. Note that surveillance case definitions are designed for public health case management and surveillance purposes, not for clinical purposes. Surveillance case definitions include clinical, laboratory and epidemiological components. The final decision on whether or not a case meets the case definition rests with the CMOH or designate.

Communicable disease information is entered into a communicable disease information system that is used to produce reports.

The Health Protection Unit is responsible for the preparation of regular reports on communicable diseases in the Territory and the dissemination of these reports to community health centers, to regional health authorities and to senior officials at the Department of Health. Since routine reports are public reports, care is taken to report cases in such a way that individuals are not identified. Most reports provide information rolled up to the regional level.

In addition, reports on diseases that are nationally notifiable are sent to PHAC. This information is included in national reports by province and territory. Reports on diseases that are notifiable to ICS are submitted to ICS and included in their reports.

### **Outbreak Reports**

Physicians and Nurses are required to report to the CMOH if they observe that a communicable disease or an undiagnosed syndrome (such as diarrheal illness) is occurring in unusual numbers. The CMOH or delegate is responsible for following up on the report and determining if an outbreak exists which should be investigated.

## Disclosure of Information through Public Health Advisories

As noted above, summary reports on communicable diseases will be produced as public documents on a regular basis. However, during outbreaks or unusual situations it may also be necessary to inform the public of a specific situation including the steps required to protect the public. There are no hard and fast rules for the release of information in this situation. Decisions on the release of information at the community level are made on a case by case basis taking a number of key factors into consideration, including:

- Situation or disease characteristics such as infectiousness and mode of transmission.
- Interventions or prevention measures required to interrupt disease transmission.
- Confidentiality and privacy. Note: to prevent identification of an individual, the number of cases at the community level must be greater than 5 in order to report.
- Minimizing any chance of stigmatizing the community.

Examples of situations where information is released through public health advisories include:

- The presence of rabid animals in a community, e.g. positive foxes or dogs.
- An outbreak of a foodborne illness.
- An outbreak of a respiratory illness like influenza where it is important to remind the public about hand hygiene, cough etiquette and the availability of influenza immunization.
- The presence of *Trichinella* in country food.

### 3.0 Outbreak Management Guidelines

This section of the Nunavut Communicable Disease and Surveillance Manual provides guidelines for investigating and managing communicable disease outbreaks in the territory. Specific procedures for cases and special-risk groups are included in the individual disease sections of the manual. Also, key components for final outbreak reporting have been included.

#### 3.1 Principals of Outbreak Management

A community outbreak is defined as two or more cases with similar illness that can be epidemiologically-linked (associated by time, place and/or exposure). Note that a single case of certain illnesses can be considered an outbreak, e.g. *E. coli*, Measles.

The Chief Medical Officer of Health (CMOH) or Deputy Chief Medical Officer of Health (DCMOH) will lead an investigation of an outbreak.

- Immediately investigate all reports of suspected outbreaks
- Develop management plan upon outbreak confirmation
- Implement interventions and educational strategies during and following an outbreak
- Inform appropriate Department of Health (DH) staff and other stakeholders (e.g. laboratory, Wildlife Officer) of outbreak status
- Complete an outbreak report and debriefing(s)

#### 3.2 Outbreak Team

The Outbreak Team works in conjunction with appropriate internal and external partners to investigate and manage an outbreak. Membership depends on the potential outbreak source.

| Core members                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Supplemental members                                                                                                                                                                                                                                                                                                 |

### 3.4 Steps in Outbreak Investigation and Management

The following steps are not necessarily in order of priority and may be done simultaneously, depending on the outbreak situation.

|                             |                                                                                                                 |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------|
| Confirm the diagnosis       | Upon receipt of report, confirm the diagnosis and existence of an outbreak.                                     |
| Establish an Outbreak Team  | See section 4.                                                                                                  |
| Establish a case definition | This may include disease-specific clinical symptoms and/or laboratory criteria.                                 |
| Develop an interview tool   | Develop or modify an interview tool (questionnaire) and other forms as required. Review with the investigators. |

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Collect information/data     | <p>The Outbreak Team Leader determines which team members will investigate and collect all available current information, determining if any additional data is necessary. Information collected will focus on:</p> <p><b>Person</b></p> <ul style="list-style-type: none"> <li>• Personal characteristics (date of birth, sex, immune status, marital status, medical conditions, occupation, cultural norms, activities, predisposing or protecting factors)</li> <li>• Symptom inquiry: type of symptoms</li> <li>• Classification as case or contact when appropriate</li> </ul> <p><b>Place</b></p> <ul style="list-style-type: none"> <li>• Common social event, e.g. wedding, reception, party, sports</li> <li>• Common places visited, e.g. school, or other travel</li> <li>• Possible exposures, e.g. menus, common food item, pool</li> <li>• Contact with animals, pets, vectors, as appropriate</li> </ul> <p><b>Time</b></p> <ul style="list-style-type: none"> <li>• Period the cases became ill</li> <li>• Onset of symptoms</li> <li>• Duration of symptoms</li> <li>• Time between exposure to potential source (if known) and onset of symptoms</li> </ul> <p>If a common social event is identified, and the source is thought to be foodborne, determine what food was served, obtain a guest list and menu, and identify where the food was purchased. Identify common food ingested and any other food that was served that might not be on the menu.</p> <p>Information sources may include:</p> <ul style="list-style-type: none"> <li>• Interviews with cases, contacts, healthcare staff and agencies involved, e.g. school, restaurant</li> <li>• Environmental public health inspection (facility/site) reports</li> <li>• Literature review</li> <li>• Consultation with experts</li> <li>• Laboratory reports</li> <li>• Review of agency records, e.g. reservation lists</li> </ul> |
| Analyze information          | <ul style="list-style-type: none"> <li>• Review the case definition</li> <li>• Determine attack rates and epidemic curve</li> <li>• Formulate a tentative hypothesis regarding source and transmission</li> <li>• Update data collection tools as required</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Develop notifications/alerts | <p>These notifications are for confidential information sharing. For initial outbreak reports, updates (including related shared documents and correspondence) and final outbreak reports, consider notifying the following:</p> <ul style="list-style-type: none"> <li>• Appropriate regional Public Health staff and partners, e.g. laboratories</li> <li>• Within the region, consider notifying others, e.g. DH Executive Director and Population Health Director</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Develop a communication plan/education                 | <p>Work closely with appropriate communications advisor to:</p> <ul style="list-style-type: none"> <li>• Consider target groups (public, people at risk, health-care providers, media)</li> <li>• Consider key messages and methods to disseminate (fact sheets, web postings, press releases, letters, etc.)</li> <li>• Assign an Outbreak Team member as media spokesperson</li> <li>• Consider whether a toll-free telephone information line is necessary</li> </ul>                                                                                                                                                                          |
| Implement control measures based on findings           | <p>Determine interventions and treatment such as the following:</p> <ul style="list-style-type: none"> <li>• Contact tracing if required</li> <li>• Preventative measures, e.g. immunization, exclusion, prophylaxis, treatment of case</li> <li>• Removal of agents/exposure</li> <li>• Addressing the source of the outbreak (see specific disease protocol for control measures)</li> <li>• Closure of premises if required</li> <li>• Modification of procedures, e.g. swimming pool filtration</li> <li>• Cleaning or disinfection of contaminated equipment or fittings (e.g. medical devices, food preparation equipment, etc.)</li> </ul> |
| Ongoing outbreak documentation                         | <p>It is required that all outbreak-related activities are documented and the records stored in a secure location. For example, log the following:</p> <ul style="list-style-type: none"> <li>• Minutes of team meetings and conference calls</li> <li>• Notifications, alerts, and correspondence</li> <li>• Pertinent dates, e.g. date outbreak declared and date outbreak declared over</li> </ul>                                                                                                                                                                                                                                             |
| Ongoing evaluation of information and control measures | Consider the criteria for a public health emergency under the International Health Regulations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Consider further studies or special investigations     | Further studies or special investigations may be warranted to gain insight into the source, transmission, or more-effective control measures.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Declare outbreak over                                  | Decided by the Outbreak Team and communicated appropriately.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## APPENDIX A: Comprehensive Final Outbreak Report

### Outline

- I. Executive Summary
- II. Introduction and Background
- III. Methods
  - a. Epidemiological
  - b. Laboratory
  - c. Environmental Public Health
- IV. Results
  - a. Epidemiological
  - b. Laboratory
  - c. Environmental Public Health
- V. Discussion
- VI. Conclusions
- VII. Evaluation/Recommendations
- VIII. Acknowledgements
- IX. Signature Block
- X. Appendices

### Explanation

#### I. Executive Summary

Include the key features of the outbreak, addressing the “who, what, where, and when” of the outbreak. A description of the outbreak or the causal hypothesis based on the evidence should be included. Identify lessons learned, recommendations, interventions (could be ongoing), or areas that need further attention. Include important points in the report and be prepared to answer any questions with detail.

#### II. Introduction and Background

Describe the specific events that led to the investigation, including how the outbreak was first reported, steps taken to confirm the outbreak (including surveillance trends), and who assisted in the investigation. Identify the members of the outbreak team and objectives of the investigation. Background information identifies the population demographics, previous, similar outbreaks, describing the area, site or facility involved.

#### III. Methods

Outline the steps taken to investigate the outbreak.

- a. *Epidemiological methods*: Explain how cases are defined and ascertained. Outline the analytical study methodology and include interview tools and techniques used for investigation.
- b. *Environmental health methods*: Outline the number and types of environmental health investigations that occurred and who conducted these investigations. This would include site visits, risk assessment, and trace back.
- c. *Laboratory analysis*: Describe the number and types of specimens submitted for analysis.

#### **IV. Results**

Describe what was discovered.

- a. *Epidemiological results*: Highlight the number of cases, personal details, and clinical features, including geographical distribution, epidemic curve, risk factor analysis, and attack rates.
- b. *Environmental health results*: Describe the results of inspections, risk assessments, and trace back.
- c. *Laboratory results*: Summarize the results of human and food or source testing.

#### **V. Discussion**

This section brings together all aspects of the outbreak. Discussion will include the main hypotheses and justification of conclusions and actions being based on evidence or balance of probabilities. Actions taken to protect public health are described. As well, highlight the problems encountered during the investigation including the lessons learned during the outbreak, including those identified in the debriefing(s).

#### **VI. Conclusion**

Give a brief summary of the outbreak.

#### **VII. Evaluation/Recommendations**

Describe what should be done to control the outbreak, prevent future outbreaks, and improve management of outbreaks in the future. The purpose of this section is to educate, so specificity is important. Recommendations for any changes to the Outbreak Response Plan should be included.

#### **VIII. Acknowledgements**

This is an opportunity to thank those who assisted with the outbreak.

#### **IX. Appendices**

These may include a chronology of events, Outbreak Team membership, terms of reference for the team, maps and references, questionnaires, letters to health-care professionals, media releases, and fact sheets.

#### **X. Signature Block**

This report requires sign-off by the CMOH or DCMOH.

## 4.0 Enteric, Food and Waterborne Infections

### Purpose

The purpose of this section of the Communicable Disease Manual is to provide guidelines for the investigation and management of individuals who have been diagnosed with notifiable infections spread by enteric, food and waterborne routes, including Amoebiasis, Botulism, Campylobacteriosis, Cholera, Cryptosporidiosis, Cyclosporiasis, Giardiasis, Hepatitis A, Listeriosis, Norovirus, Paralytic Shellfish Poisoning, Paratyphoid, Salmonellosis, Shigellosis, Trichinosis, Typhoid, Verotoxigenic *E. coli*, and Yersiniosis.

### Legislation/Policy

Authority for the reporting of notifiable infections spread by enteric, food and waterborne routes and their public health management comes from the *Public Health Act, Communicable Disease Regulations*.

All clients who have been diagnosed with a notifiable infection spread by enteric, food and waterborne routes must be reported to the Chief Medical Officer of Health (CMOH).

All clients who are suspected to have or have a confirmed notifiable infection spread by enteric, food and waterborne routes are to be followed as per the protocols in this section.

### Roles and Responsibilities

**Table 4.1: Roles and responsibilities for follow up of notifiable infections spread by enteric, food and waterborne routes**

| Role                                                                                 | Responsibilities                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Reporting:** To report infections in this section of the Communicable Disease Manual, use the  
**Food and Waterborne Illness Investigation Form**

## 4.1.1 Amoebiasis

### Special Precautions/Considerations

Precautions: Contact

#### Reporting

Notifiable: Yes

Reporting: Routine (within 7 days)

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Infectious Agent</b>              | Amoebiasis is an enteric infection caused by a protozoan parasitic organism <i>Entamoeba histolytica</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Clinical</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Clinical Presentation</b>         | Many cases are asymptomatic. Symptoms, when present, are diverse; more severe cases may experience acute amebic dysentery, including one to three weeks of increasing diarrhea containing blood and mucous, lower abdominal pain, tenesmus, possible weight loss and fever.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Diagnostics</b>                   | <p>The diagnosis of amoebiasis is made by microscopic demonstration of trophozoites or cysts in fresh or preserved fecal specimens, smears of aspirates or scrapings obtained by proctoscopy, aspirates of abscesses or sections of tissue.</p> <p>Serological testing for antibodies may be used in diagnosis for extra-intestinal amoebiasis, such as liver abscess, where stool examination is often negative; however, this is not consistently reliable. Ultrasound or CT scans can identify liver abscesses and other extra-intestinal sites of infection.</p> <p>Follow your regional laboratory procedures for testing.</p>                                                                                                                                                             |
| <b>Treatment</b>                     | Symptomatic cases should be treated. Consult with the physician for treatment recommendations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Occurrence</b>                    | <p><b>Worldwide:</b> Occurs worldwide but is more prevalent in areas with poor sanitation. Amoebiasis is the third leading parasitic cause of death in developing countries and is a common cause of diarrhea in travellers and recent immigrants. Higher rates of cyst passage have been observed in areas with poor sanitation, in institutions, and among men who have sex with men (MSM). In areas with good sanitation infections tend to cluster in households.</p> <p><b>Canada:</b> The number of reported cases per year in Canada (1987 to 1999) ranged from a high of 2334 (rate 8.55/100,000) in 1989 to a low of 1379 (rate 4.52/100,000) in 1999. Young adults are most often affected (20 to 39 years).</p> <p><b>Nunavut:</b> There have been no reported cases since 2000.</p> |
| <b>Reservoir</b>                     | Humans; usually a chronically ill or asymptomatic cyst passer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Transmission</b>                  | Mainly through ingestion of fecally contaminated food or water containing amoebic cysts, which are relatively chlorine resistant. Transmission may occur sexually by fecal-oral contact.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Incubation Period</b>             | From a few days to several months or years; commonly two to four weeks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Communicability</b>               | Communicable as long as <i>E. histolytica</i> cysts are passed; this may be years if left untreated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Susceptibility and Resistance</b> | Universal susceptibility. Those individuals with immunodeficiencies (including AIDS) may suffer more severe forms of the disease. Susceptibility to re-infection is rare.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Public Health Management

| <b>Case</b>                                                                   | <p>Confirm the diagnosis – ensure that all suspect cases receive prompt investigative procedures to confirm the case. Contact and interview the case, parent or guardian.</p> <p>Investigate cases to determine the source of infection, being sure to obtain the following disease-specific information:</p> <ul style="list-style-type: none"> <li>• Food and water history (retain all suspected food or water for laboratory analysis based on Environmental Health Officer [EHO] direction).</li> <li>• History of recent (international) travel.</li> <li>• Sexual history.</li> </ul> <p>Cases should be instructed about disease transmission and prevention.</p> <p>Exclusion is at the discretion of the Chief Medical Officer of Health (CMOH) / Deputy CMOH. Consult with the EHO regarding exclusion criteria described below:</p> <table border="1" data-bbox="440 751 1469 1108"> <thead> <tr> <th>Risk Group</th><th>Criteria for Exclusion</th></tr> </thead> <tbody> <tr> <td>Food Handlers</td><td>Exclude until asymptomatic and stool is formed.</td></tr> <tr> <td>Health care, nursery or other staff who have contact with susceptible persons</td><td>Exclude until asymptomatic and stool is formed.</td></tr> <tr> <td>Children less than 5 years old attending daycare</td><td>Exclude until asymptomatic and stool is formed.</td></tr> <tr> <td>Case contacts who are in special risk groups</td><td>Contacts that develop gastrointestinal symptoms should be tested for <i>E. histolytica</i>.</td></tr> </tbody> </table> | Risk Group | Criteria for Exclusion | Food Handlers | Exclude until asymptomatic and stool is formed. | Health care, nursery or other staff who have contact with susceptible persons | Exclude until asymptomatic and stool is formed. | Children less than 5 years old attending daycare | Exclude until asymptomatic and stool is formed. | Case contacts who are in special risk groups | Contacts that develop gastrointestinal symptoms should be tested for <i>E. histolytica</i> . |

| <b>Infectious Agent</b>      | Botulism is caused by toxins produced by <i>Clostridium botulinum</i> , a spore-forming obligate anaerobic bacillus. Most human botulism is caused by toxin types A, B, E, F and G.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Clinical Presentation</b> | <p><b>Foodborne and wound botulism</b> present as a disease of the nervous system characterized by blurred or double vision, dysphagia, dysphonia, dry mouth and dysarthria. Descending symmetrical flaccid paralysis may follow. Vomiting, constipation and diarrhea may also be present. Fever is usually absent.</p> <p><b>Intestinal (infant and adult) botulism</b> may present initially in infants as gastrointestinal upset with constipation, listlessness, weak cry, poor feeding, diminished gag reflex, loss of head control and generalized weakness ("floppy infant"). These symptoms may lead to respiratory difficulties and arrest. The illness may be mild or severe and may be associated with Sudden Infant Death Syndrome (SIDS).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Diagnostics</b>           | <p>Botulism diagnosis is based primarily on clinical presentation and should be suspected in a person with acute onset of gastrointestinal, autonomic (such as dry mouth or difficulty focusing eyes), and cranial-nerve dysfunction (diplopia, dysarthria, dysphagia). The diagnosis is even more likely if the patient has recently eaten aged country foods, home-canned foods or if family members/companions who have shared the same meals are similarly ill.</p> <p>Testing of samples for suspect cases of botulism will be coordinated through the Chief Medical Officer of Health (CMOH)/Deputy CMOH or designate. Most specimens collected (food and clinical) are sent to the Botulism Reference Laboratory in Ottawa, Ontario.</p> <p>Laboratory evaluation includes anaerobic cultures and toxin assays of serum, stool, and the implicated food if available. Cases caught early are more likely to be diagnosed by the toxin assay, whereas those studied later in the disease are more likely to have a positive culture than a positive toxin assay. Toxin excretion may continue up to one month after the onset of illness, and stool cultures may remain positive for a similar period.</p> |
| <b>Treatment</b>             | <p>Individuals with botulism require immediate emergency medical treatment; such treatment must not await medical confirmation.</p> <p><b>Foodborne and wound botulism:</b> Immediate respiratory assessment and management is essential. Consult with Physician immediately. Botulism antitoxin is usually available at each Community Health Centre and Regional Pharmacy.</p> <p><b>Intestinal (infant) botulism:</b> Consult with physician immediately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Occurrence</b>            | <b>Worldwide:</b> Sporadic cases, family and general outbreaks occur when food is prepared or preserved by methods that do not destroy spores and permit toxin formation. Cases rarely result from contaminated commercially processed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                                      | <p>products; however, outbreaks have occurred from contamination through cans damaged after processing.</p> <p><b>Canada:</b> Since first being reported in 1933, foodborne botulism remains a rare disease that primarily affects the First Nations and Inuit people. A published review of outbreaks from 1919 to 1973 documents that two-thirds of the 62 outbreaks reported involved Inuit and West Coast Aboriginal people. Type E toxin is most commonly seen in foodborne cases in Canada. Infant botulism is rare in Canada with only seven cases reported since 1979. The source is rarely identified.</p> <p><b>Nunavut:</b> There were two confirmed cases of foodborne Botulism in Nunavut between 2006 and 2015.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Reservoir</b>                     | <p><i>Botulinum</i> spores are ubiquitous in soil worldwide. They are frequently recovered from agricultural products, including honey, and are also found in marine sediments in the intestinal tract of animals, including fish.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Transmission</b>                  | <p><b>Foodborne botulism</b> is transmitted by the ingestion of improperly prepared, stored or cooked food containing the toxin. The foods most often implicated are canned foods (vegetables and fruits), home preserved foods, smoked fish, seal meat and other arctic marine mammals such as whale meat.</p> <p><b>Wound botulism</b> occurs when <i>C. botulinum</i> contaminates a wound and is accompanied by anaerobic conditions that allow for <i>in-vivo</i> toxin production in the wound. Historically, the primary cause of wound botulism was due to soil contamination from a penetrating trauma or crush injury. But in the past decade, parenteral drug abuse related cases have surpassed those related to trauma. Most cases of wound botulism are associated with the intramuscular or subcutaneous injection of (contaminated) black tar heroin as well as sinusitis in those who snort cocaine.</p> <p><b>Intestinal (infant) botulism</b> is typically associated with the ingestion of spores that germinate and produce toxin in-vivo that may be present in items such as foods, soil, dust, unpasteurized honey and peanut butter.</p> |
| <b>Incubation Period</b>             | <p><b>Foodborne:</b> Neurological symptoms usually appear within 12 to 36 hours after ingestion of contaminated food (range is 6 hours to 8 days). The shorter the incubation period, the more severe the disease and the higher the case-fatality rate.</p> <p><b>Wound:</b> Usually 4 to 14 days from the time of injury to onset of symptoms.</p> <p><b>Intestinal (infant):</b> Unknown, as the precise time of ingestion often cannot be determined.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Communicability</b>               | <p>No direct person to person transmission has been documented.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Susceptibility and Resistance</b> | <p>Susceptibility is general. Adults with special bowel problems leading to unusual gastrointestinal flora (or with a flora unintentionally altered by antibiotic treatment for other purposes) may be susceptible to intestinal botulism. Injection drug users (IDUs) who intentionally or accidentally inject subcutaneously or intramuscularly have been vulnerable to infection. Immunity to botulism toxin does not develop even following severe disease.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Public Health Management

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Case</b>             | <p>Confirm the diagnosis – ensure that all suspect cases receive prompt investigative procedures to confirm the case. Contact and interview the case, parent or guardian. Complete the <b>Food and Waterborne Illness Investigation Form</b> dated March 2014 or later.</p> <p>Treatment of clinical cases should not be delayed until laboratory confirmation. Treatment is under the direction of the attending health care provider in consultation with an infectious disease specialist.</p> <p><b>Foodborne Botulism</b></p> <ul style="list-style-type: none"> <li>• Inform the Environmental Health Officer</li> <li>• Take a detailed food history of those who are ill, especially foods consumed within the last two or three days. Include consumption of home-preserved foods and traditionally prepared foods. Even theoretically unlikely foods should be considered. <i>C. botulinum</i> may or may not cause container lids to bulge and the contents to have “off-odours.” Other contaminants can also cause cans or bottle lids to bulge.</li> <li>• Collect food samples and forward to the laboratory for toxin analysis.</li> <li>• Collect clinical samples (sera, gastric aspirates and stool) from patients and, when indicated, <b>before</b> administration of antitoxin.</li> <li>• Identify individuals who may have been exposed to the same source.</li> </ul> <p><b>Infant Botulism</b></p> <ul style="list-style-type: none"> <li>• Investigate source, in particular, history of honey consumption.</li> <li>• Identify individuals who may have been exposed to the same source.</li> </ul> <p><b>Wound Botulism</b></p> <ul style="list-style-type: none"> <li>• Determine if history of trauma, or IDU and if possible forward sample of drug for testing.</li> <li>• Identify individuals who may have been exposed to the same source.</li> </ul> |
| <b>Contacts</b>         | <p>Botulism is not passed person to person, therefore, direct contacts of the index case do not require follow-up.</p> <p>People who are known to have eaten contaminated food or who have shared a likely exposure should be advised to consult with a healthcare provider for assessment and/or treatment. Treatment may include purging with cathartics, gastric lavage and high enemas, and close medical observation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Outbreaks</b>        | <p>A single case of botulism should be considered an outbreak and be managed with great urgency, in collaboration with the CMOH/DCMOH. Contact your Environmental Health Officer (EHO) immediately if even a single case of botulism is suspected.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Health Education</b> | <p>Educate the public about the safe handling of food. For example:</p> <ul style="list-style-type: none"> <li>• Keep aging meats such as whale, seal or walrus in a cool place (below 4°C), in containers that allow air in and, if aged in oil, keep in a cool place and stir frequently to allow the meat to be in contact with air.</li> <li>• Do not use food from damaged or bulging containers. These containers should be returned unopened to the vendor.</li> <li>• Foods with off-odours and unusual tastes should not be eaten or ‘taste-tested’.</li> <li>• Proper storage is one of the keys to food safety. Refrigeration slows down most bacterial growth. Encourage people to check the temperature of their</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Infectious Agent</b>      | The bacterium <i>Campylobacter jejuni</i> and less commonly <i>Campylobacter coli</i> are the usual causes of campylobacteriosis. <i>Campylobacter</i> species are motile Gram-negative bacilli that cause gastroenteritis.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Clinical Presentation</b> | <p>Severity of symptoms may vary. Illness is characterized by diarrhea, abdominal pain, malaise, fever and nausea and vomiting. The symptoms can vary from mild to severe, can mimic appendicitis and can also be asymptomatic. Relapses can occur. Blood and mucous may be present in liquid stools. Infection is most often self-limited and symptoms cease within 2 to 5 days.</p> <p>Less common presentations include typhoid-like syndrome, febrile convulsions or meningitis; post-infectious complications include reactive arthritis, febrile convulsions or Guillain-Barre syndrome (GBS).</p>                 |
| <b>Diagnostics</b>           | <p>Diagnosis is made by culture of the organism from stool. Isolation of <i>C. jejuni</i> from food is difficult as the bacteria are usually present in low numbers.</p> <p>Follow your regional laboratory procedures for testing.</p>                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Treatment</b>             | Treatment recommendations are under the direction of the attending healthcare provider. Specific treatment is generally not indicated except for supportive treatment, including rehydration and electrolyte replacement. However, treatment with certain antibiotics may shorten duration of illness and prevent relapse when given early in illness. Consult with the physician appropriate treatment information.                                                                                                                                                                                                     |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Occurrence</b>            | <p><b>Worldwide:</b> <i>Campylobacter</i> species cause approximately 5 to 14% of diarrheal illness worldwide and it is an important cause of traveller's diarrhea. Common source outbreaks occur.</p> <p><b>Canada:</b> Campylobacteriosis occurs year round with a peak in summer and early fall. The highest incidence is in children under the age of five years and young adults. The rate in Canada has remained relatively stable. From 1988 to 2000, the rate ranged from 37.7 to 48.7/100,000.</p> <p><b>Nunavut:</b> There have been an average of 2 cases per year since 2000 (range 0-6 cases per year).</p> |
| <b>Reservoir</b>             | Feces of an infected animal or human. The gastrointestinal tract of animals and birds (especially pets, cattle, chickens, turkey, and water fowl) can be a reservoir.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Transmission</b>          | Ingestion of the organisms in undercooked meat and poultry, contaminated food and water, or raw milk and other dairy products; contact with infected pets (especially puppies and kittens), farm animals or infected infants. The infective dose is often low. Person to person transmission appears uncommon.                                                                                                                                                                                                                                                                                                           |
| <b>Incubation Period</b>     | Usually 2 to 5 days, with a range of 1 to 10 days depending on the dose ingested.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Communicability</b>       | Persons not treated with antibiotics may excrete the organism for as long as two to seven weeks. Communicable for 2 to 3 days after starting treatment with appropriate antibiotics.                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Susceptibility and Resistance</b>                                          | Immune mechanisms are not well understood, but infection with <i>Campylobacter</i> confers lasting immunity to that strain. In developing countries, most people develop immunity in the first two years of life.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |            |                        |               |                                                                   |                                                                               |                                                                   |                                                  |                                                                                                                                                      |                                              |                                                                                                                                                     |

## **Approval**

Approved by Dr. Maureen Baikie, Chief Medical Officer of Health on September 18, 2015.

## 4.4.1 Cholera

### Special Precautions/Considerations

Precautions: Routine

\*Consider Contact precautions for incontinent clients and children under 6

### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

| <b>Infectious Agent</b>      | Two strains of cholera are associated with infection: <i>Vibrio cholerae</i> serogroup O1 and <i>V. cholerae</i> serogroup O139. These are gram-negative, non-spore forming bacteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Clinical Presentation</b> | Most cases are asymptomatic, although the bacterium is present in their feces for 7 to 14 days. When illness does occur, infection causes only mild to moderate diarrhea in approximately 90% of individuals. In 5 to 10% of those infected, individuals develop severe, watery diarrhea and vomiting. Stools are typically colourless with flecks of mucous referred to as “rice water” diarrhea. The resulting loss of fluids in an infected individual can rapidly lead to severe dehydration. If not treated, death can occur within hours.                                                                                                                                                                                                    |
| <b>Diagnostics</b>           | Diagnosis is made by culturing <i>Vibrio cholerae</i> serogroup O1 or O139 from stool.<br><br>Follow your regional laboratory procedures for testing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Treatment</b>             | Mild disease does not require the use of antimicrobial therapy.<br><br>Prompt fluid therapy with volumes of electrolyte solution adequate to correct dehydration, acidosis and hypokalemia is the keystone of treatment.<br><br>Since serogroups O1 or O139 can be resistant to antimicrobials and the treatment options are extensive, Consultation with an infectious disease physician is suggested.                                                                                                                                                                                                                                                                                                                                            |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Occurrence</b>            | <b>Worldwide:</b> Cholera outbreaks can occur sporadically in any part of the world where water supplies, sanitation, food safety, and hygiene are inadequate. The greatest risk of cholera occurs in overpopulated communities and refugee settings characterized by poor sanitation and unsafe drinking water.<br><br><b>Canada:</b> Cholera was first reported in Canada in 1974. It is rarely seen. Since 1989 there has been an average of three cases per year reported in Canada. Four cases were reported in 2002 and five cases were reported in 2003. All reported cases have been related to travel or immigration. No secondary transmission occurred.<br><br><b>Nunavut:</b> There have been no reported cases of Cholera in Nunavut. |
| <b>Reservoir</b>             | Humans are the only documented natural hosts, but living <i>V. cholerae</i> organisms can exist in the aquatic environment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Transmission</b>          | Ingestion of food or water contaminated with feces or vomitus of infected humans and occasionally feces of carriers; consumption of raw or improperly cooked seafood, and other foods harvested from estuarine water or seawater. Direct person-to-person transmission has not been documented.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Incubation Period</b>     | Usually 2 to 3 days, ranges from a few hours to 5 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Communicability</b>                                    | For the duration of the stool-positive stage, usually until 2 to 3 days after recovery; however, a carrier state may persist for months. Appropriate antibiotics can shorten the period of communicability, but are not recommended for treatment.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Susceptibility and Resistance</b>                      | <p>Susceptibility is variable; gastric achlorhydria (low gastric acid secretion) and the lack of immunity seen in small children may increase the risk of illness, whereas breastfed infants are protected.</p> <p>In endemic areas, most people acquire antibodies by early adulthood. Infection with O1 serogroup affords no protection against O139 infection and vice versa.</p>                                                                                                                                                                                                                                                                                                               |
| <b>Public Health Management</b>                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Case</b>                                               | <p>Confirm the diagnosis – ensure that all suspect cases receive prompt investigative procedures to confirm the case. Contact and interview the case, parent or guardian.</p> <p>Treatment is under the direction of the attending health care provider in consultation with an infectious disease specialist.</p> <p>All cases should be instructed about disease transmission, appropriate personal hygiene, routine practices, and contact precautions.</p> <p>Exclusion of cases is at the discretion of the CMOH/DCMOH.</p>                                                                                                                                                                   |
| <b>Contacts</b>                                           | <p>There is no documented person-to-person transmission of cholera, however:</p> <ul style="list-style-type: none"> <li>• Persons who shared food and drink with a confirmed cholera case should be asked to report any diarrheal symptoms for five days from their last exposure.</li> <li>• Exclusion of contacts is at the discretion of the CMOH/DCMOH if deemed a transmission risk.</li> <li>• If there is a high probability of transmission based on food preparation history and usual hygiene, household members may be considered for chemoprophylaxis.</li> </ul>                                                                                                                      |
| <b>Outbreaks</b>                                          | Contact your Environmental Health Officer (EHO) if even a single case of cholera is suspected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Health Education</b>                                   | <p>Educate those travelling to cholera-endemic areas:</p> <ul style="list-style-type: none"> <li>• Advise travellers to take appropriate precautions to avoid contact with, or ingestion of, potentially contaminated food or water. Most travellers visiting an area where cholera occurs are at very low risk of acquiring infection.</li> <li>• Avoid eating raw oysters and undercooked fish and shellfish.</li> <li>• Consult with a travel clinic regarding cholera occurrence and vaccination recommendations.</li> <li>• Educate the general public and especially food handlers about careful handwashing after toileting, sexual contact and before preparing or eating food.</li> </ul> |

| <b>Clinical Presentation</b> | Asymptomatic infections are common. Symptoms may include watery diarrhea accompanied by abdominal pain, and sometimes fever, malaise, nausea, and vomiting and loss of appetite. In immunocompromised individuals (e.g., persons with HIV infection) chronic severe diarrhea can result in dehydration and possibly death.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Diagnostics</b>           | Diagnosis is made through examination of stools, intestinal fluid or small bowel biopsy for oocysts or parasitic antigens. It may require more than one specimen due to intermittent shedding of oocysts during infection.<br><br>Follow your regional laboratory procedures for testing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Treatment</b>             | In most cases, cryptosporidiosis is a self-limited disease; administer rehydration and electrolyte replacement as indicated.<br><br>There is no treatment of known value. For chronic cases, consult with the Chief Medical Officer of Health (CMOH)/Deputy CMOH or infectious disease specialist.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Occurrence</b>            | <b>Worldwide:</b> <i>Cryptosporidium</i> is considered one of the most common enteric pathogens in humans and domestic animals worldwide. Children under six years of age, animal handlers, travellers, Men who have Sex with Men, and close personal contacts of infected individuals (families, healthcare and daycare workers) are most likely to become infected. The incidence is greatest in the summer and early fall (outdoor swimming season). Outbreaks in North America and Europe have been associated with contaminated drinking water, contaminated swimming pools, water parks and lakes, and unpasteurized apple cider.<br><br><b>Canada:</b> Recent outbreaks and cases in Canada have been associated with swimming in and drinking contaminated pool water.<br><br><b>Nunavut:</b> There have been a total of 16 reported cases in Nunavut from 2007–2011. |
| <b>Reservoir</b>             | Humans, cattle, and sheep are the principal reservoirs for <i>Cryptosporidium</i> . Other domestic animals including birds and reptiles, and occasionally wild animals are also reservoirs for this parasite.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Transmission</b>          | Fecal-oral contact between humans and between animals and humans. Ingestion of contaminated food and water. Transmission between sexual partners has been reported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Incubation Period</b>     | Not precisely known. It has been suggested that one to 12 days is the likely range with an average of 7 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Communicability</b>       | From onset of symptoms until several weeks after symptoms resolve. Outside the body the pathogen remains infective for 2 to 6 months in a moist environment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Susceptibility and Resistance</b>                                          | Universal susceptibility. Persons with intact immune functions usually have asymptomatic or self-limited infections. The illness may be prolonged in severely immunocompromised individuals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |            |                        |               |                                                                   |                                                                               |                                                                   |                                                       |                                                                   |                                                          |                                                                                                                       |

| <b>Infectious Agent</b>              | <i>Cyclospora cayetanensis</i> , a sporulating coccidian parasite that infects the upper small bowel. <i>Cyclospora</i> are resistant to chlorination.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Clinical</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Clinical Presentation</b>         | Abrupt onset of profuse, watery diarrhea. Nausea, vomiting, anorexia, substantial weight loss, abdominal bloating or cramping and prolonged fatigue can also occur. Diarrhea can alternate with constipation. The infection is typically self-limited, lasting 2 to 7 weeks; however in some untreated cases, persistent diarrheal illness may occur.                                                                                                                                                                                                                |
| <b>Diagnostics</b>                   | Diagnosis is made by the identification of oocysts in the stool, duodenal/jejunal aspirate, or small bowel biopsy specimen.<br><br>Follow your regional laboratory procedures for testing.                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Treatment</b>                     | In most cases, Cyclosporiasis is a self-limited disease and treatment is not indicated. Oral trimethoprim-sulfamethoxazole for 7 days may be recommended. Consult with physician for treatment recommendations.                                                                                                                                                                                                                                                                                                                                                      |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Occurrence</b>                    | <b>Worldwide:</b> <i>Cyclospora</i> infections occur in clusters and sporadically worldwide but are most common in tropical and subtropical areas. Prevalence in North America is thought to be low, however since 1990, at least 11 food-borne outbreaks have occurred in Canada and the United States affecting approximately 3600 persons.<br><br><b>Canada:</b> Recent outbreaks and cases in Canada have been associated with the consumption of contaminated berries, predominantly imported raspberries.<br><br><b>Nunavut:</b> No reported cases since 2000. |
| <b>Reservoir</b>                     | Confirmed natural infection in animals and humans has not been documented.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Transmission</b>                  | Primarily through consumption of contaminated water, or swimming in contaminated water. Some outbreaks have been associated with consumption of fresh produce, but the way in which the produce was contaminated has not been identified; <i>Cyclospora</i> is not naturally found in or on fresh fruits and vegetables or any other foods. Agricultural water may play a role in contamination. <i>Cyclospora</i> is not infectious at the time it is excreted in the stool. Person to person and animal to person transmission have not been documented.           |
| <b>Incubation Period</b>             | Approximately 7 days, range of 1 to 14 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Communicability</b>               | The disappearance of symptoms and oocysts usually occurs simultaneously. The mean duration of organism shedding is 23 days.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Susceptibility and Resistance</b> | Available evidence is limited, however believed to be universal susceptibility. Persons who have been treated for previous <i>Cyclospora</i> infection can be re-infected.                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Case Definition</b>                                    | <p><b>Confirmed case:</b><br/>Laboratory confirmation of infection in a person with or without clinical illness (see below):</p> <ul style="list-style-type: none"> <li>• Demonstration of <i>Cyclospora cayetanensis</i> oocytes in stool, duodenal/jejunal aspirate or small bowel biopsy.</li> </ul> <p><b>Probable case:</b><br/>Clinical illness (see below) in a person with evidence of:</p> <ul style="list-style-type: none"> <li>• An epidemiological link to a confirmed case either by consumption of the same food or exposure to food known to be handled by a confirmed case,<br/><b>OR</b></li> <li>• A history of travel to a cyclospora-endemic area.</li> </ul> <p><b>Clinical illness:</b><br/>Clinical illness is characterized by watery diarrhea, loss of appetite, weight loss, abdominal bloating and cramping, increased flatus, nausea, fatigue and low-grade fever. Vomiting may also be noted. Relapses and asymptomatic infections can occur.</p> |
| <b>Reporting Requirements and Forms</b>                   | <b>Cyclosporiasis is a notifiable infection in Nunavut;</b> however, surveillance is laboratory-based only. Submission of case report forms (routine or enhanced) is <b>not required</b> , unless specifically requested by the Chief Medical Officer of Health (CMOH)/Deputy CMOH or designate. Report outbreaks to the EHO, who will report these to the Office of the CMOH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Infectious Agent</b>      | Giardiasis is caused by the protozoa <i>Giardia lamblia</i> . The organism is found in two forms, a trophozoite and a cyst. The trophozoite is relatively fragile and dies when excreted from the body. The cyst form is environmentally resistant and thrives in still bodies of water such as ponds and stagnant lakes. It can also be found in fecally contaminated surfaces and food items.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Clinical Presentation</b> | <p>Giardiasis is often asymptomatic. Symptomatic individuals may suffer a broad spectrum of manifestations including the acute onset of intermittent acute watery diarrhea, steatorrhea, abdominal cramps and distention, flatulence, and anorexia. Periods of diarrhea may alternate with constipation until the individual has been treated or the symptoms resolve spontaneously. Vomiting, fever, and tenesmus occur less commonly. One of the most distinguishing features of illness is the prolonged duration of diarrhea. As the disease progresses the stool becomes greasy, foul-smelling, and may float. The malabsorption of fats and fat soluble vitamins can occur with prolonged illness. Weight loss is common.</p> <p>The infection is often self-limited lasting a few weeks to months. Most persons with giardiasis have a relatively benign course of infection; however some individuals, in particular children younger than five years of age and pregnant women, may have severe illness characterized by weight loss and require hospitalization.</p> |
| <b>Diagnostics</b>           | <p>Giardiasis should be considered in persons with prolonged diarrhea especially when associated with malabsorption or weight loss. The diagnosis is most often made by examination of stool for ova and parasites, looking for trophozoites or cysts or by serology EIA.</p> <p>Follow your regional laboratory procedures for testing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Treatment</b>             | <p>Treatment is under the direction of the attending healthcare provider. Symptomatic cases should be treated. Consult with physician for treatment recommendations.</p> <p>Treatment of asymptomatic carriers is generally not recommended.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Occurrence</b>            | <p><b>Worldwide:</b> Worldwide occurrence. <i>Giardia lamblia</i> is one of the most common causes of endemic and epidemic diarrhea throughout the world. Prevalence is highest in areas of poor sanitation and in facilities where children are not toilet trained. Waterborne outbreaks have occurred in communities that derive water from sources without a filtration system.</p> <p><b>Canada:</b> The most prevalent enteric parasite in Canada, <i>Giardia lamblia</i> is the most frequent cause of non-bacterial diarrhea. Rates are highest in young children. Infection occurs most commonly in July and August.</p> <p><b>Nunavut:</b> From 2007–2011, the number of reported symptomatic cases ranged from 6 –11 per year.</p>                                                                                                                                                                                                                                                                                                                                   |

| <b>Transmission</b>                                                           | <p>Transmission is fecal-oral, most commonly occurs through the ingestion of contaminated water and occasionally from swimming in contaminated water sources. Surface water can easily become contaminated by the feces of human or animal sources. Routine water treatment does not kill <i>Giardia</i> cysts. Filtration is necessary.</p> <p>Anal-oral contact may also occur. Foodborne transmission has also been documented. The infectious dose is generally less than 10 cysts and may be as low as one cyst.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |            |                        |               |                                                                                                 |                                                                               |                                                                                                 |                                                       |                                                                                                 |                                              |                                                                                                                                                                     |
| <b>Incubation Period</b>                                                      | Usually 3 to 25 days or longer; the median incubation period is 7 to 10 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |            |                        |               |                                                                                                 |                                                                               |                                                                                                 |                                                       |                                                                                                 |                                              |                                                                                                                                                                     |
| <b>Communicability</b>                                                        | Varies. Giardiasis is communicable during the entire period of infection (as long as a person excretes the cysts), which may last months. About 50% of adults clear the infection spontaneously in 1 to 3 months. Five to 15% of individuals become asymptomatic cyst passers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |            |                        |               |                                                                                                 |                                                                               |                                                                                                 |                                                       |                                                                                                 |                                              |                                                                                                                                                                     |
| <b>Susceptibility and Resistance</b>                                          | Most common in children less than 5 years of age and in adults 25 to 39 years of age; asymptomatic carrier rates are high. Persons with immunodeficiencies (e.g., HIV or AIDS) can experience a more serious and prolonged illness.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |            |                        |               |                                                                                                 |                                                                               |                                                                                                 |                                                       |                                                                                                 |                                              |                                                                                                                                                                     |

| <b>Infectious Agent</b>      | Hepatitis A virus (HAV), an RNA picornavirus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Clinical Presentation</b> | <p>Acute clinical illness is characterized by fever, malaise, anorexia, nausea and abdominal pain followed by jaundice. The disease varies in clinical severity from a mild illness lasting one to two weeks, to a severely disabling disease lasting several months, although this is rare. Prolonged or relapsing disease lasting as long as six months can occur. Fulminant hepatitis is rare but more frequent in individuals with underlying liver disease. In general, severity increases with age, but complete recovery without sequelae or recurrences is the rule. Chronic infection does not occur.</p> <p>Infection usually causes clinical hepatitis in adults and school-aged children but younger children are often asymptomatic. Jaundice develops in less than 10% of children 6 years of age and younger.</p>                                                                                                                                                                                                                                                                                                                                                      |
| <b>Diagnostics</b>           | <p>Hepatitis A is not clinically distinguishable from other forms of viral hepatitis; therefore, a diagnosis is established by the demonstration of IgM antibody to HAV (anti-HAV IgM) in the serum of acutely or recently ill persons. IgM is detectable 5-10 days before the onset of symptoms and may remain detectable for 4-6 months after onset. IgM disappears from the serum and IgG persists, conferring lifelong immunity.</p> <p>Follow your regional laboratory procedures.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Treatment</b>             | Supportive care. Hepatitis A is a viral disease; antibiotics are of no value in the treatment of the infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Occurrence</b>            | <p><b>Worldwide:</b> Hepatitis A occurs worldwide. In developing countries, adults are usually immune and epidemics of hepatitis A are uncommon. In developing countries with poor environmental hygienic conditions, nearly all children are infected with HAV before the age of nine. In developed countries, disease transmission is frequent in travelers to countries where the disease is endemic, daycare centers enrolling diapered children, and in household and sexual contacts of acute cases.</p> <p><b>Canada:</b> Like most industrialized countries, Canada has a relatively low incidence of hepatitis A. Each year, 1,000 to 3,000 cases are reported. The incidence of hepatitis A varies with geography, as well as economic and environmental conditions. In Canada, risk factors for hepatitis A (HA) infection include:</p> <ul style="list-style-type: none"> <li>• Travel to HA endemic countries.</li> <li>• Household or close contact with an acute HA case.</li> <li>• Men who have sex with men (MSM).</li> <li>• Illicit drug use.</li> <li>• Populations or communities that have high endemic rates of HA or are at risk of HA outbreaks.</li> </ul> |

| <b>Reservoir</b>                     | Humans; rarely chimpanzees and other primates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Transmission</b>                  | <p>HAV infection is spread directly person to person primarily by the fecal-oral route by either direct contact with an infected individual or indirectly by ingestion of contaminated food or water. Infection may occur by consumption of contaminated ice/water or by ingestion of uncooked or undercooked foods that have been washed in contaminated water.</p> <p>Transmission also occurs through sexual activities that include direct or indirect anal-oral contact but not through exposure to saliva, semen or urine. On rare occasions, transmission has been reported after exposure to HAV-contaminated blood or blood products.</p> <p>The virus may persist for days or weeks in the environment.</p>                                                                                                                                                                                                                                                                                                                                                     |
| <b>Incubation Period</b>             | Ranges from 15 to 50 days with an average of 28 to 30 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Communicability</b>               | Maximum infectiousness occurs during the latter part of the incubation period with peak levels in the 1 to 2 weeks before the onset of illness to 1 week after the onset of jaundice.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Susceptibility and Resistance</b> | Susceptibility is general, however sexual and household contacts are at increased risk of infection. Infection with HAV confers lifelong immunity. In serologic studies of HA vaccines, 95% to 100% of those vaccinated developed protective concentrations of antibody against HA after a single dose of HA vaccine, and nearly 100% seroconverted after receiving two doses. Protective concentrations of antibody will likely persist for at least 20 years, possibly for life, following immunization with two doses of HA vaccine. Immune memory has been demonstrated indicating that protection may persist even when antibodies are no longer measurable.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Case</b>                          | <p>Confirm the diagnosis – ensure that all suspect cases receive prompt investigative procedures to confirm the case. Contact and interview the case, parent or guardian.</p> <p>Investigate cases of hepatitis A to determine the source of infection, being sure to obtain the following disease-specific information:</p> <ul style="list-style-type: none"> <li>History of exposure to possible sources (see Transmission section).</li> <li>Food and water history in the past 30 days.</li> <li>History of recent (international) travel.</li> </ul> <p>All cases should be instructed about disease transmission, appropriate personal hygiene, routine practices, and contact precautions.</p> <p>Provide Health Education to case on transmission and prevention of the disease.</p> <p>Determine if case is a food handler, a health care provider or staff of a childcare (daycare) facility. Exclusion is at the discretion of the Chief Medical Officer of Health (CMOH)/Deputy CMOH. Consult with the EHO regarding exclusion criteria described below:</p> |

|                  | <b>Risk Group</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>Criteria for Exclusion</b>                                                                             |

| <b>Contacts</b>  | <p>Determine the potential contacts during the infectious period (14 days before the onset of symptoms to 7 days after the onset of jaundice). Identify all contacts, in particular:</p> <ul style="list-style-type: none"> <li>• Those living in the same household.</li> <li>• Persons who are close non-household contacts such as sexual partners or drug sharing partners.</li> <li>• Co-workers and clients of infected food handlers.</li> </ul> <p>Post-exposure prophylaxis should be offered to household and close contacts of proven or suspected cases of HAV. Post-exposure prophylaxis is generally not necessary for other contacts, such as school, workplace or health care workers caring for HAV cases unless an outbreak is suspected, however this decision is at the discretion of the CMOH/DCMOH. Hepatitis A vaccine and immune globulin are used for post-exposure prophylaxis as described below. Contact your RCDC for additional information.</p> <p><b>Hepatitis A vaccine</b></p> <p>Hepatitis A vaccine is effective as post-exposure prophylaxis to prevent infection in contacts and is recommended in preference to immune globulin for people over one year of age. One dose of hepatitis A vaccine should be given to susceptible contacts as soon as possible and preferably within 14 days of last exposure. However, hepatitis vaccine should still be considered if more than 14 days have elapsed since last exposure, as there are no data on the outer limit of efficacy.</p> <p><b>Immune globulin (Ig)</b></p> <p>Ig is the recommended post-exposure immunoprophylactic agent for infants less than one year of age, for those for whom vaccine is contraindicated, and if hepatitis A vaccine is unavailable. Immunocompromised people should receive Ig in addition to hepatitis A vaccine because they may not respond fully to the vaccine. For post-exposure prophylaxis, give Ig as soon as possible after an exposure. Efficacy of Ig is unknown after 14 days post exposure. See Immunization Manual for protocols for Hepatitis A vaccine and Ig.</p> <ul style="list-style-type: none"> <li>• Provide contacts with information on transmission and prevention of infection.</li> <li>• Symptomatic contacts that work in high risk settings should be assessed by a health care provider to determine if they are infected.</li> <li>• Exclusion is at the discretion of the CMOH/DCMOH as per the criteria above (see Case section).</li> </ul> |                                                                                                           |

| <b>Reporting Requirements and Forms</b>                   | <b>Hepatitis A is a notifiable infection in Nunavut;</b> however, surveillance is laboratory-based only. Submission of case report forms (routine or enhanced) is <b>not required</b> , unless specifically requested by the CMOH/DCMOH or designate. Report outbreaks to the EHO immediately, who will report these to the Office of the CMOH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Tools</b>                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Infectious Agent</b>      | <i>Listeria monocytogenes</i> are small gram-positive, non-spore forming, aerobic bacilli. The bacteria survive well in soil, water, food, and feces. They are able to grow at low temperatures (3°C to 45°C) and are resistant to freezing and drying.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Clinical Presentation</b> | <p>The clinical manifestations of infection range from a mild febrile gastroenteritis in healthy hosts to severe illness in pregnant women and the immunocompromised. Symptoms may include fever, muscle aches, and on occasion, nausea and vomiting. The bacteria may infect the brain and the membrane lining the brain causing meningoencephalitis, with sudden onset of fever, intense headache, nausea, and vomiting.</p> <p>Infected pregnant women may have minimal symptoms typically characterized by a mild flu-like illness, but may unknowingly pass the illness to their unborn child. Infants may be stillborn or born with septicaemia, or may develop meningitis in the neonatal period even though the mother may be asymptomatic at delivery. The case fatality rate is 30% in newborns and approaches 50% if the onset of illness occurs within the first four days of life.</p> |
| <b>Diagnostics</b>           | <p>The diagnosis is confirmed by isolation of the bacteria from CSF, blood, amniotic fluid, placenta, meconium, lochia, gastric washings, and other sites of infection. <i>Listeria monocytogenes</i> can be readily isolated from normally sterile sites on routine media.</p> <p>Follow your regional laboratory procedures.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Treatment</b>             | Immediate treatment is essential. Consult with an infectious disease specialist for treatment recommendations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Occurrence</b>            | <p><b>Worldwide:</b> Listeriosis occurs worldwide. Illness is rare and most infections are asymptomatic.</p> <p><b>Canada:</b> Invasive Listeriosis has been reportable in Canada since 1990. From 1990 to 1999, the rate remained below 1/100,000.</p> <p><b>Nunavut:</b> There have been no reported cases from 2007–2011.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Reservoir</b>             | <i>Listeria monocytogenes</i> is ubiquitous. It has been isolated in soil, dust, water, and foods. The primary reservoirs are soil and decomposing organic matter. Other reservoirs include the intestinal tract of domestic and wild mammals, fowl, and, on occasion, humans. Asymptomatic fecal carriage occurs in man (10%) and animals. The bacteria are frequently found in free-living water and mud. Soft cheeses may support the growth of <i>Listeria</i> during ripening and have caused outbreaks. Unlike most other foodborne pathogens, <i>Listeria</i> is extremely hardy and can multiply in refrigerated foods that are contaminated.                                                                                                                                                                                                                                               |
| <b>Transmission</b>          | A substantial proportion of sporadic cases results from foodborne transmission. Livestock become infected after ingesting contaminated silage or water; vegetables and fruit may become contaminated from the soil or from manure used as a fertilizer. The bacterium has been found in raw foods, such as                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                                      | <p>uncooked meats and vegetables, as well as in processed foods that become contaminated after processing, such as soft cheeses and ready-to-eat meats such as hot dogs and deli meats. Unpasteurized milk or food made from unpasteurized milk may contain the bacterium.</p> <p>In neonatal infections, the organism can be transmitted from mother to fetus <i>in utero</i>, or during passage through the infected birth canal.</p>                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Incubation Period</b>             | Variable, and longer than most common foodborne pathogens; incubation ranges from 3 to 70 days with an estimated median of 3 weeks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Communicability</b>               | Mothers of infected newborns can shed the bacteria in vaginal discharges and urine for 7-10 days after delivery, rarely longer. Infected persons may retain the bacteria in their stools for several months; however, secondary infections among household contacts have not been identified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Susceptibility and Resistance</b> | Fetuses and newborns are highly susceptible. Infection in children and young adults generally cause less severe disease than in the immunocompromised and the elderly. There is a strong association between decreased immunity and invasive listeriosis, and disease is often superimposed on other debilitating illnesses or conditions such as malignancy, organ transplantation, diabetes, cirrhosis, renal disease, HIV infection and those on immune suppressing medications. There is little evidence of acquired immunity, even after prolonged severe infection.                                                                                                                                                                                                                                                                                             |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Approved by Dr. Maureen Baikie, Chief Medical Officer of Health on January 19, 2014.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## 4.10.1 Norovirus

### Special Precautions/Considerations

Precautions: Contact precautions

#### Reporting

Notifiable: Yes

Reporting: Routine (within 7 days)

|                                      |                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Infectious Agent</b>              | Noroviruses are a group of viruses that can cause gastroenteritis. The group of viruses have also been called Norwalk-like viruses.                                                                                                                                                                                                                                     |
| <b>Clinical</b>                      |                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Clinical Presentation</b>         | Acute onset of nausea, vomiting, non-bloody diarrhea, abdominal pain, myalgia, headache, malaise, low-grade fever or a combination of these symptoms, generally lasting 24 to 48 hours.                                                                                                                                                                                 |
| <b>Diagnostics</b>                   | <p>The diagnosis is confirmed by isolation of the virus from stool.</p> <p>In general, laboratory testing is only performed in relation to gastrointestinal illness outbreak investigations.</p> <p>Follow your regional laboratory procedures.</p>                                                                                                                     |
| <b>Treatment</b>                     | Treatment is supportive.                                                                                                                                                                                                                                                                                                                                                |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Occurrence</b>                    | <p><b>Worldwide:</b> Norovirus is a common source of diarrhea and vomiting worldwide.</p> <p><b>Canada:</b> Norovirus is a common source of diarrhea and vomiting in Canada. The number of cases is unknown as individual cases of norovirus are not nationally notifiable.</p> <p><b>Nunavut:</b> Norovirus is a common cause of diarrhea and vomiting in Nunavut.</p> |
| <b>Reservoir</b>                     | Humans are the only known reservoir. The main source is stool and vomit from infected persons.                                                                                                                                                                                                                                                                          |
| <b>Transmission</b>                  | Transmission by the fecal-oral route. Person-to-person transmission occurs either directly or indirectly through environmental contact such as contaminated food, water and fomites. Aerosolized transmission from vomitus has been reported. Single or multiple modes of transmission have been reported.                                                              |
| <b>Incubation Period</b>             | 24 to 48 hours.                                                                                                                                                                                                                                                                                                                                                         |
| <b>Communicability</b>               | Usually occurs during the acute stage of the illness, but can be up to 48 hours after the diarrhea stops and sometimes longer.                                                                                                                                                                                                                                          |
| <b>Susceptibility and Resistance</b> | Universal susceptibility. Immunity does not develop after infection. Norovirus illness can be serious, especially for young children and older adults.                                                                                                                                                                                                                  |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Case</b>                          | Individual cases of norovirus are not typically followed by public health. Only outbreaks are to be reported to public health. Any exclusions will be at the discretion of the Chief Medical Officer of Health (CMOH)/Deputy CMOH and will be according to the general guidelines for enteric illness (Appendix A).                                                     |
| <b>Contacts</b>                      | Contacts of norovirus cases are typically not followed by public health.                                                                                                                                                                                                                                                                                                |
| <b>Outbreaks</b>                     | If an outbreak of norovirus is suspected, contact your Environmental Health Officer (EHO).                                                                                                                                                                                                                                                                              |
| <b>Health Education</b>              | <ul style="list-style-type: none"> <li>Provide public education about personal hygiene, especially the sanitary disposal of feces and careful hand washing after defecation and sexual contact, and before preparing or eating food.</li> </ul>                                                                                                                         |

Approved by Dr. Maureen Baikie, Chief Medical Officer of Health on September 9, 2015.

## 4.11.1 Paralytic Shellfish Poisoning

### Special Precautions/Considerations

Precautions: Routine

#### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

| <b>Infectious Agent</b>      | Paralytic Shellfish Poisoning (PSP) is caused by the presence in shellfish of marine biotoxins, saxitoxins and gonyautoxins produced by microscopic plants, Alexandrium species and other dinoflagellates. Concentration of these toxins occurs during massive algal blooms known as "red tides" but also in the absence of recognizable algal bloom.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Clinical Presentation</b> | PSP is a potent neurotoxin that can pose a severe health threat. The intensity and progression of the symptoms are dependent on the type and amount of the toxin ingested and the level of concentration of the toxin in the shellfish. Symptoms begin with a tingling sensation or numbness around the lips within 5 to 30 minutes of ingestion, gradually spreading to the face and neck. Other symptoms may include prickly sensation in the fingertips/toes, headache, dizziness or a "floating" sensation. Gastrointestinal symptoms such as nausea, vomiting and abdominal pain are less common. Symptoms usually resolve within a few hours to a few days. In severe cases, incoherent speech, a prickly sensation in the arms and legs, stiffness and non-co-ordination of limbs, weakness and a rapid pulse may occur. In extreme cases, the respiratory muscles may become paralyzed leading to respiratory arrest and death within 2 to 12 hours after consumption. |
| <b>Diagnostics</b>           | A diagnosis of PSP should be considered based on observation of clinical symptoms with recent consumption of shellfish. Confirmation of the diagnosis can be made by detection of the toxin in samples of stomach contents, water or food.<br><br>Follow your regional laboratory procedures.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Treatment</b>             | There is no known antidote for PSP. Respiratory support may be indicated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Occurrence</b>            | <b>Worldwide:</b> Paralytic shellfish poisoning has occurred worldwide and is common in shellfish harvested from waters above 30°N and below 30°S. The most common areas are the northwest and northeast United States, southern Chile, the North Sea and Japan. Paralytic shellfish poisoning is uncommon in North America with small clusters occurring sporadically mainly in coastal locations.<br><br><b>Canada:</b> Shellfish can have high levels of marine toxins during any given month depending on environmental conditions however, algal blooms of dinoflagellates usually occur during the warmer months of June to October. Cases of PSP are likely rare in Canada but also may be under reported as it was only been made nationally notifiable in 2008.<br><br><b>Nunavut:</b> There have been no reported cases from 2007–2013.                                                                                                                              |
| <b>Reservoir</b>             | Contaminated shellfish, including oysters, clams, mussels and certain crabs and snails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Transmission</b>          | Consumption of raw or cooked contaminated shellfish.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Incubation Period</b>     | Symptoms usually occur within a few minutes to 10 hours after ingestion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Communicability</b>       | Not applicable; not transmitted person to person.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Susceptibility and Resistance</b>                      | Variable; some individuals have a natural tolerance to large amounts of the toxin and others have demonstrated an acquired tolerance. Children are more susceptible. Alcohol consumption may have a protective effect against the toxins by having a diuretic effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Public Health Management</b>                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Case</b>                                               | <p>Confirm the diagnosis – ensure that all suspect cases receive prompt investigative procedures to confirm the case. Contact and interview the case, parent or guardian. Complete the <a href="#"><i>Food and Waterborne Illness Investigation Form</i></a> dated March 2014 or later.</p> <p>Determine the possible source of the infection taking into consideration the incubation period and reservoir. Assessment may include:</p> <ul style="list-style-type: none"> <li>• Determining history of travel,</li> <li>• Taking a food history for shellfish consumption,</li> <li>• Determining where the case purchased or consumed shellfish (e.g., restaurant, fish vendor, grocery store), and/or</li> <li>• If the case harvested the shellfish, determine the area where it was harvested.</li> </ul> <p>Identify epidemiologically linked contacts. Assess for similar symptoms in individuals who consumed the source (if identified).</p> <p>Suspected contaminated shellfish may be held to prevent consumption and sent to CFIA for testing based on Environmental Health Officer (EHO) direction.</p> |
| <b>Contacts</b>                                           | <ul style="list-style-type: none"> <li>• Although not transmissible from person to person, contact follow-up is recommended for those who may have shared the same food as a case.</li> <li>• These individuals should be instructed in disease symptoms, when to seek medical attention, transmission, incubation period and preventive measures.</li> <li>• Symptomatic contacts should be instructed to seek immediate medical attention.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Outbreaks</b>                                          | If even a single case of PSP is suspected, contact your EHO.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Health Education</b>                                   | <ul style="list-style-type: none"> <li>• Consumers should exercise caution when purchasing or harvesting bivalve shellfish. <ul style="list-style-type: none"> <li>◦ Shellfish should only be purchased from a reputable retail store or restaurant as the shellfish sold in these establishments come from a federally inspected shellfish processing plant.</li> </ul> </li> <li>• Bivalve shellfish are highly perishable and should be refrigerated or frozen until they are ready to be eaten. The toxins are heat stable and water soluble and not destroyed by cooking or freezing. The toxins are not detectable by sight or smell.</li> <li>• As PSP can occur in other countries, tourists should be cautious when consuming shellfish abroad.</li> </ul>                                                                                                                                                                                                                                                                                                                                                   |

## **Approval**

Approved by Dr. Maureen Baikie, Chief Medical Officer of Health on March 16, 2014.

## 4.12.1 Paratyphoid

### Special Precautions/Considerations

Precautions: Routine

\*Consider Contact precautions for incontinent clients and children under 6.

### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

| <b>Clinical</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Clinical Presentation</b>         | Characterized by insidious onset of sustained fever, dull frontal headache, malaise, myalgia, non-productive cough, anorexia, nausea and abdominal discomfort. Constipation is more common than diarrhea. The clinical presentation is highly variable, ranging from mild illness with low-grade fever to severe clinical disease with multiple complications.                                                                                                                                                        |
| <b>Diagnostics</b>                   | S. Paratyphi can be isolated from blood early in the disease and from urine and feces after the first week of illness. Blood culture is the diagnostic mainstay.<br><br>Follow your regional laboratory procedures.                                                                                                                                                                                                                                                                                                   |
| <b>Treatment</b>                     | <ul style="list-style-type: none"> <li>Evidence suggests fluoroquinolones are the drug of choice in adults, however resistance has been observed.</li> <li>Consult with an infectious disease specialist for treatment recommendations.</li> </ul>                                                                                                                                                                                                                                                                    |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Occurrence</b>                    | <p><b>Worldwide:</b> Paratyphoid occurs worldwide. Most of the burden of illness occurs in the developing world. An estimated 6 million cases of paratyphoid fever occur worldwide annually.</p> <p><b>Canada:</b> The incidence of paratyphoid remains very low in Canada. In 1999, S. paratyphoid infection was removed from the nationally notifiable disease list as a separate entity and was included under Salmonella infections.</p> <p><b>Nunavut:</b> There have been no reported cases from 2007–2011.</p> |
| <b>Reservoir</b>                     | Humans, rarely animals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Transmission</b>                  | Fecal-oral from person to person, or by ingestion of food or water contaminated by feces or urine of the infected person. Consumption of shellfish harvested from beds contaminated by sewage or fruits and vegetables fertilized by human waste and eaten raw.                                                                                                                                                                                                                                                       |
| <b>Incubation Period</b>             | From 1 to 10 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Communicability</b>               | Communicable as long as organisms are excreted; from the appearance of prodromal symptoms, throughout illness and for a period of up to 2 weeks after symptom onset. Few persons with paratyphoid infection become chronic carriers.                                                                                                                                                                                                                                                                                  |
| <b>Susceptibility and Resistance</b> | Susceptibility is general and is increased in individuals with gastric achlorhydria and possibly in those who are HIV positive. Relative specific immunity follows recovery from clinical disease and inapparent infection.                                                                                                                                                                                                                                                                                           |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Case</b>                          | Confirm the diagnosis – ensure that all suspect cases receive prompt investigative procedures to confirm the case. Contact and interview the case, parent or guardian.                                                                                                                                                                                                                                                                                                                                                |

Investigate cases of paratyphoid to determine the source of infection, being sure to obtain the following disease-specific information:

- History of recent international travel.
- History of exposure to possible sources (see Transmission section).
- Food and water history in the 10 days prior to symptom onset.

All cases should be instructed about disease transmission, appropriate personal hygiene, routine practices, and contact precautions.

Provide Health Education to case on transmission and prevention of the disease.

Identify close contacts (see Contacts section).

Determine if case is a food handler, a health care provider or staff of a childcare (daycare) facility. Exclusion is at the discretion of the Chief Medical Officer of Health (CMOH)/Deputy CMOH. Consult with the EHO regarding exclusion criteria described below:

| Risk Group                                                                    | Criteria for Exclusion                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Food Handlers                                                                 | Exclude until 3 consecutive stool samples are negative. They are to be collected one week apart and at least 24 hrs after cessation of symptoms. If treated, then specimens must be collected at least two weeks after completion of antibiotic treatment.            |
| Health care, nursery or other staff who have contact with susceptible persons | Exclude until 3 consecutive stool samples are negative. They are to be collected one week apart and at least 24 hrs after cessation of symptoms. If treated, then specimens must be collected at least two weeks after completion of antibiotic treatment.            |
| Children less than 5 years old attending daycare etc                          | Exclude until 3 consecutive stool samples are negative. They are to be collected one week apart and at least 24 hrs after cessation of symptoms. If treated, then specimens must be collected at least two weeks after completion of antibiotic treatment.            |
| Case contacts who are in special risk groups                                  | <i>Symptomatic:</i> Exclude and have stool samples cultured for confirmation. If positive, handle as a case. If negative, exclude until symptoms have cleared and stools are well formed.<br><br><i>Asymptomatic:</i> This must be evaluated on a case by case basis. |

**Carriers:**

If a person remains positive for more than 12 months, they may be considered a chronic carrier. Maintain surveillance of chronic carriers until they are cleared; this requires they submit 3 consecutive negative stool cultures, taken not less than 24 hours apart and at least 48 hours after the termination of any

|                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Infectious Agent</b>      | <i>Salmonella enterica</i> , a gram negative enteric bacillus. There are over 2000 serotypes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Clinical Presentation</b> | <p>Salmonellosis is a bacterial infection manifested by an acute enterocolitis associated with a sudden onset of headache, abdominal pain and tenderness, diarrhea, nausea, and occasionally vomiting. Dehydration may be a severe complication. Symptoms may last for one or two days or be prolonged depending on host factors, the ingested dose, and strain characteristic.</p> <p>Occasionally, the bacteria may spread to the bloodstream and localize in any tissue of the body, producing abscesses and other systemic complications.</p> <p>Arthritis-type symptoms may follow three to four weeks after onset of acute symptoms.</p> <p>Asymptomatic infection may occur. Death is uncommon, except in the very old, the very young and in persons with compromised immune systems.</p> |
| <b>Diagnostics</b>           | <p>The diagnosis is made through the isolation of <i>Salmonella</i> from feces, rectal swabs or other body fluids. Freshly passed stool is preferred. Specimens should be collected over several days as excretion of the bacteria may be intermittent.</p> <p>Collect stool for culture and sensitivity (C&amp;S) test. Follow your regional laboratory procedures.</p>                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Treatment</b>             | None, antibiotic treatment may lengthen the period of communicability. Under special circumstances an antibiotic may be given (i.e., infants under 2 months, the elderly, and individuals with HIV infection).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Occurrence</b>            | <p><b>Worldwide:</b> Worldwide occurrence. Salmonellosis is endemic in some parts of the world with the highest attack rates in persons less than five years and greater than 70 years of age. It is believed that only a small proportion of cases are acknowledged. In developed countries, it is estimated that only about 1% of clinical cases are reported.</p> <p><b>Canada:</b> Since 1988, there has been a slight overall decline in the number of cases reported in Canada. Currently, about 5,500 cases are reported in Canada each year, but this number is considered an underestimate. Infants and young children have the highest incidence.</p> <p><b>Nunavut:</b> There have been an average 16 reported cases per year from 2007–2011 (range 6–34 cases per year).</p>          |
| <b>Reservoir</b>             | <p>The reservoir for salmonellosis includes a wide range of domestic and wild animals, including poultry, swine, cattle, rodents, and pets such as iguanas, tortoises, turtles, terrapins, snakes, chicks, dogs and cats.</p> <p>Humans may also serve as a reservoir (e.g., acute cases, convalescent carriers and mild and unrecognized illness). Chronic carriers in humans are rare but common in animals and birds.</p>                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Transmission</b>                                                           | Fecal-oral, from person/animal to person, or by ingestion or handling of food derived from infected animals or contaminated by the feces of an infected person or animal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |            |                        |               |                                                                   |                                                                               |                                                                   |                                                       |                                                                   |                                                          |                                                                                                                                       |

| <b>Incubation Period</b>                                                      | Varies from 6 to 72 hours, usually 12-36 hours.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |            |                        |               |                                                                   |                                                                               |                                                                   |                                                       |                                                                   |                                                          |                                                                                                                                       |
| <b>Communicability</b>                                                        | Shedding of the bacteria in stool occurs throughout the entire infection; usually several days to several weeks. A temporary carrier state usually continues for months, especially in infants. Depending on the serotypes, approximately 1% of infected adults and 5% of children less than 5 years of age may excrete the organism for more than one year.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |            |                        |               |                                                                   |                                                                               |                                                                   |                                                       |                                                                   |                                                          |                                                                                                                                       |
| <b>Susceptibility and Resistance</b>                                          | Susceptibility is general but may be increased by antacid treatment, gastrointestinal surgery, prior or current broad-spectrum antibiotic therapy, neoplastic disease, and other immunosuppressive conditions including malnutrition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |            |                        |               |                                                                   |                                                                               |                                                                   |                                                       |                                                                   |                                                          |                                                                                                                                       |

## 4.14.1 Shigellosis

### Special Precautions/Considerations

Precautions: Direct and Indirect Contact

#### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Infectious Agent</b>      | <p>Shigellosis is an acute bacterial disease caused by gram negative bacilli in the family Enterobacteriaceae. It is the most communicable of the bacterial diarrheas. Some strains produce enterotoxin and shigatoxin (much like the verotoxin of <i>E. coli</i> O157:H7). Approximately 40 serotypes are divided into four groups:</p> <ul style="list-style-type: none"> <li>• Group A - <i>Shigella dysenteriae</i></li> <li>• Group B - <i>Shigella flexneri</i></li> <li>• Group C - <i>Shigella boydii</i></li> <li>• Group D - <i>Shigella sonnei</i></li> </ul>                                                                                                                                                                                                                                                                                                       |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Clinical Presentation</b> | <p>An acute bacterial disease involving the distal small intestine and colon, characterized by watery, loose stools, accompanied by fever, nausea and vomiting in mild cases. Sometimes, toxemia, abdominal cramps and tenesmus with mucoid stools with or without blood in more severe cases. Illness is usually self-limiting, lasting an average of 4 to 7 days. Asymptomatic infections occur. Severity and case-fatality vary with the age of the host and the serotype of <i>Shigella</i>.</p>                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Diagnostics</b>           | <p>Diagnosis is made by the isolation of <i>Shigella</i> from feces or a rectal swab. The infection is generally associated with a high number of leukocytes (pus cells) in the fecal matter. <i>Shigella</i> remains viable outside the human body for only a short period of time hence, specimens must be processed rapidly after collection, preferable within 24 hours.</p> <p>Serological testing is not generally helpful.</p> <p>Follow your regional laboratory procedures for testing.</p>                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Treatment</b>             | <p>Treatment is under the direction of the attending healthcare provider. Consult with physician for treatment recommendations.</p> <ul style="list-style-type: none"> <li>• Fluids and electrolyte replacement if excessive fluid loss through diarrhea or vomiting.</li> <li>• Antimotility agents are not recommended as they may prolong the course of disease.</li> <li>• Treatment is recommended for most symptomatic patients. Use of antibiotics will shorten the period of fecal excretion of the infecting strain and will shorten the clinical course of disease often to a few days.</li> <li>• Antibiotics <ul style="list-style-type: none"> <li>o If the strain is susceptible, ciprofloxacin or TMP/SMX or azithromycin are recommended for adults and children.</li> <li>o Antibiotic resistance frequently develops after treatment.</li> </ul> </li> </ul> |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Occurrence</b>            | <p><b>Worldwide:</b> Worldwide occurrence. It is estimated that Shigellosis causes 600,000 deaths per year in the world. Reported cases represent only a small proportion of all cases. Secondary attack rates in households have been shown to be as high as 40%. Approximately two thirds of the cases are children under the age of 10. The disease does not often develop in infants less than six months of age.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                                                                               | <p><b>Canada:</b> Periodic outbreaks occur. Young children have been most affected. Outbreaks are most commonly associated with crowded conditions and facilities where hygiene is poor (e.g., jails).</p> <p><b>Nunavut:</b> There have been no reported cases from 2007–2011.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |            |                        |               |                                                                                                                                                                                                              |                                                                               |                                                                                                                                                                                                              |

| <b>Reservoir</b>                                                              | Humans and primates are the reservoir for <i>shigella</i> . The source is most often the feces of infected individuals who have diarrhea. Other potential sources include contaminated food (especially when unrefrigerated, e.g., salads), raw vegetables, milk, dairy products, and water.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |            |                        |               |                                                                                                                                                                                                              |                                                                               |                                                                                                                                                                                                              |
| <b>Transmission</b>                                                           | The primary mode of transmission is fecal-oral. Transmission occurs through person-to-person contact, ingestion of contaminated food or water, through sexual contact or less commonly through contact with inanimate objects. Risk of transmission occurs particularly among men having sex with men and in areas of overcrowding where sanitation is poor, such as jails, institutions, daycare centres or mental hospitals. Only a very small dose (10-100 bacteria) is required for infection to occur. Multi-antibiotic resistant strains have appeared worldwide, resulting from widespread use of antibiotics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |            |                        |               |                                                                                                                                                                                                              |                                                                               |                                                                                                                                                                                                              |
| <b>Incubation Period</b>                                                      | Usually 1 to 3 days, but may range from 12 hours to 1 week.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |            |                        |               |                                                                                                                                                                                                              |                                                                               |                                                                                                                                                                                                              |
| <b>Communicability</b>                                                        | During acute infection and until the infectious agent is no longer present in feces, usually within 4 weeks after illness. Effective antibiotic therapy reduces communicability to less than a week. Secondary attack rates in households can be as high as 40%. Asymptomatic carriers may transmit infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |            |                        |               |                                                                                                                                                                                                              |                                                                               |                                                                                                                                                                                                              |
| <b>Susceptibility and Resistance</b>                                          | Susceptibility is general; the elderly, the debilitated and the malnourished of all ages are particularly susceptible to severe disease and death.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |            |                        |               |                                                                                                                                                                                                              |                                                                               |                                                                                                                                                                                                              |

| <b>Infectious Agent</b>      | There are many species of <i>Trichinella</i> capable of causing infection in mammals, but <i>Trichinella nativa</i> , an intestinal nematode, is the etiological agent of Trichinosis in Arctic communities. <i>T. nativa</i> differs from other <i>Trichinella</i> species in that it is very resistant to freezing and may be more an intestinal disease and less muscle invasive than other strains. Cysts have remained viable for many years. In other regions, <i>T. spiralis</i> is a common cause of human infection. Illness is caused by intestinal roundworms whose larvae migrate to and become encysted in muscles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Clinical Presentation</b> | <p>Clinical illness in humans is highly variable and ranges from inapparent infection to fulminating, fatal illness, depending on dose ingested. Gastrointestinal symptoms may appear first, including diarrhea, nausea and abdominal pain. Other early signs of infection can include muscle soreness, fever and edema of upper eyelids. Thirst, profuse sweating, chills and weakness follow. Cardiac and neurological conditions may appear in 3-6 weeks.</p> <p>Symptomatic individuals are often not recognized because many people with a previous history of infection will (only) have diarrhea, a fairly common presenting problem. Rash and fever are also very common presenting conditions. Usually the Health Centre and community do not realize that anything is amiss until numerous persons have presented.</p> <p>Two distinct syndromes have been described in outbreaks in the Arctic, the classic "myopathic" form with edema, fever, fatigue, rash and muscle pain and a "diarrheic" form with persistent diarrhea with little fatigue or muscle pain. Sometimes the clinical picture is mixed.</p> <p>Previous research in Arctic communities suggests that the "myopathic" form represents a primary infection while the "diarrheic" form represents re-infection of individuals who have pre-existing immunity to <i>T. nativa</i>.</p> <p>Attack rates, the number of people who get sick from having consumed contaminated meat, are usually around 50%. Individuals may be unaware of which animal they consumed, and not all cuts of meat are equally contaminated – the larval form of <i>T. nativa</i> may have predisposition to certain muscle groups.</p> <p>Trichinosis should be suspected in any person who has any of the cardinal features of periorbital edema, myositis, fever, and eosinophilia in particular if history reveals consumption of poorly cooked meat.</p> |
| <b>Diagnostics</b>           | <p>The diagnosis of Trichinosis is based on history of consumption of potentially contaminated meat, the presence of compatible signs and symptoms, and identification of <i>Trichinella</i> larvae in biopsy muscle tissue or specific antibody in serum.</p> <p>Serological tests and marked eosinophilia are helpful in the diagnosis. Antibodies are not detectable until at least 3 weeks after infection. They may be measured by EIA. A diagnostic titre is 1:128. A rising antibody titre may help</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                   | <p>establish the diagnosis. It is recommended to have an acute and convalescent blood sample 4 weeks apart. A muscle biopsy is often positive when taken in the 4<sup>th</sup> and 5<sup>th</sup> week after infection (e.g. after consumption of contaminated meat) by demonstrating an un-calcified parasite cyst.</p> <p>Follow your regional laboratory procedures for testing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Treatment</b>  | <p>For treatment purposes, anyone who consumed implicated meat should be considered for treatment if consumption occurred within 3 weeks of presentation.</p> <p>Recommendations:</p> <ol style="list-style-type: none"> <li>1. Little value in doing serology in humans – treat based on suspected symptoms and a history of consuming tainted meat (waiting for serology gives sufficient time for the parasite to enter the muscle at which time antiparasitic treatment is not effective)</li> <li>2. For healthy individuals (&gt;2years old and not pregnant) with <ol style="list-style-type: none"> <li>i. no symptoms or mild symptoms, treat with 3 days of TID mebendazole (Reference JF Proulx et al Clinical Infectious Diseases, Vol. 34, No. 11 (Jun. 1, 2002), pp. 1508-1514 – study done in Nunavut related to walrus consumption)</li> <li>ii. moderate symptoms, treat with mebendazole 400mg TID for 14 days and consult MD, may benefit from corticosteroids</li> <li>iii. severe symptoms – requires hospitalization and urgent consult with MD</li> </ol> </li> <li>3. For immunosuppressed individuals or children 2-18years <ol style="list-style-type: none"> <li>i. No symptoms or mild symptoms, treat with mebendazole 400mg TID for 14 days</li> <li>ii. Moderate or severe symptoms or if age less than 2yrs or if pregnant, urgent consult with MD</li> </ol> </li> <li>4. If &lt;2years old or pregnant consult MD</li> </ol> <p>Notes: Albendazole may be better absorbed than mebendazole and it is easier to compound for children</p> |
| <b>Pathogen</b>   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Occurrence</b> | <p><b>Worldwide:</b> Worldwide occurrence. The number of cases depends on the practices used in preparing and eating meat. The disease is often unrecognized or unreported.</p> <p><b>Canada:</b> Throughout the Arctic, but variable in incidence depending on food handling and consumption practices. Recent experience has been of localized outbreaks, based on the informal sharing of food. A harvested animal is often left for individuals to take portions for family consumption.</p> <p><b>Nunavut:</b> On average, Nunavut reports 1-2 community outbreaks per year. Since 1999, outbreaks have been reported in Qikiqtarjuaq, Sanikiluaq, Igloodik, Repulse Bay, and most recently in Cape Dorset (2006).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Reservoir</b>  | <p>Animals are the only reservoir for this parasite. This includes swine, dogs, cats, horses, rats and many wild animals such as bear, wolf, fox and marine mammals.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                      | <p>It can be found in several Arctic mammals but walruses and polar bears (consumed much less frequently than walrus) are associated with outbreaks in humans in Nunavut. Other carnivore species with human outbreak potential are red and arctic foxes and wolves – but they too are very rarely consumed.</p> <p>Trichinosis infection rates in polar bears have ranged from 24-60%, and in walruses between 1-4%. Rates differ from location to location and may increase with the age of the animal.</p> <p>Walrus contamination may increase with age. Young animals feed exclusively on clams, but older ones may become infected through the consumption of other “apex” predators. Approximately one-third of foxes and wolves are infected.</p>                                                                                                                                                                          |
| <b>Transmission</b>                  | By eating of raw, fermented or insufficiently cooked flesh with viable encysted larvae. Larvae develop into adults in the epithelium of the small intestine. Gravid female worms then produce larvae that penetrate the lymphatics or venules and migrate to muscle where encapsulation occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Incubation Period</b>             | In previous Arctic outbreaks, an incubation period of 10-15 days is suggested. This can vary from 5-45 days depending on the number of parasites involved; consumption of a highly infected animal may shorten the incubation period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Communicability</b>               | Not directly transmitted from person to person. Animal host likely remains infectious for months and meat from these animals' remains infective until the larvae are killed by sufficient cooking, or irradiation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Susceptibility and Resistance</b> | Susceptibility is universal; infection results in partial immunity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## **Approval**

Approved by Dr. Kim Barker, Chief Medical Officer of Health on June 5, 2018.

## 4.16.1 Typhoid

### Special Precautions/Considerations

Precautions: Routine

\*Consider Contact precautions for incontinent clients and children under 6.

### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Infectious Agent</b>              | Caused by the gram-negative bacillus <i>Salmonella typhi</i> , which differs from most other <i>Salmonella</i> species in that it infects only humans and frequently causes severe systemic illness.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Clinical</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Clinical Presentation</b>         | Characterized by insidious onset of sustained fever, dull frontal headache, malaise, myalgia, non-productive cough, anorexia, nausea and abdominal discomfort. Constipation is more common than diarrhea. The clinical presentation is highly variable, ranging from mild illness with low-grade fever to severe clinical disease with multiple complications.                                                                                                                                                                                                                                                                |
| <b>Diagnostics</b>                   | <i>S. typhi</i> can be isolated from blood early in the disease and from urine and feces after the first week of illness. Blood culture is the diagnostic mainstay. Follow your regional laboratory procedures.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Treatment</b>                     | Evidence suggests fluoroquinolones are the drug of choice in adults, however resistance has been observed.<br>Consult with an Infectious Disease Specialist for treatment recommendations.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Occurrence</b>                    | <p><b>Worldwide:</b> Typhoid occurs worldwide; the estimated annual incidence is about 22 million cases with approximately 200,000 deaths. Most of the burden of illness occurs in the developing world.</p> <p><b>Canada:</b> The incidence of Typhoid is very low in Canada. The greatest risk of typhoid infection for Canadians occurs while travelling to countries where sanitation is likely to be poor and associated with exposures to food and water in uncontrolled settings. (e.g., market stalls, street vendors, family settings).</p> <p><b>Nunavut:</b> There have been no reported cases from 2007–2011.</p> |
| <b>Reservoir</b>                     | Humans; household contacts may be transient or permanent carriers. The chronic carrier state is most common among persons infected during middle age, especially women, and they frequently have biliary tract abnormalities including gallstones.                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Transmission</b>                  | Fecal-oral from person to person, or by ingestion of food or water contaminated by feces or urine of the infected person. Consumption of shellfish harvested from beds contaminated by sewage or fruits and vegetables fertilized by human waste and eaten raw.                                                                                                                                                                                                                                                                                                                                                               |
| <b>Incubation Period</b>             | From 3 days to over 60 days; usual range is 8-14 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Communicability</b>               | Usually from the first week of illness throughout convalescence. Two to 5 percent of those infected may become chronic carriers of <i>S. typhi</i> . In those treated with appropriate antibiotics, fewer than 2% become carriers or relapse.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Susceptibility and Resistance</b> | Susceptibility is general and is increased in individuals with gastric achlorhydria and possibly in those who are HIV positive. Relative specific immunity follows recovery from clinical disease and inapparent infection. Typhoid vaccines confer partial immunity and may be overwhelmed by a large inoculum of <i>S. typhi</i> .                                                                                                                                                                                                                                                                                          |

## Public Health Management

### Case

Confirm the diagnosis – ensure that all suspect cases receive prompt investigative procedures to confirm the case. Contact and interview the case, parent or guardian. Complete the **Food and Waterborne Illness Investigation Form** dated March 2014 or later (section 4.16.2).

Investigate cases of Typhoid to determine the source of infection, being sure to obtain the following disease-specific information:

- History of recent international travel.
- Typhoid immunization status (note vaccination information).
- History of exposure to possible sources (see Transmission section).
- Food and water history in the 14 days prior to symptom onset.

All cases should be instructed about disease transmission, appropriate personal hygiene, routine practices, and contact precautions.

Provide Health Education to case on transmission and prevention of the disease.

Identify close contacts (see Contacts section).

Determine if case is a food handler, a health care provider or staff of a childcare (daycare) facility. Exclusion is at the discretion of the Chief Medical Officer of Health (CMOH)/Deputy CMOH. Consult with the Environmental Health Officer (EHO) regarding exclusion criteria described below:

| Risk Group                                                                    | Criteria for Exclusion                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Food Handlers                                                                 | Exclude until 3 consecutive stool samples are negative. They are to be collected one week apart and at least 24 hrs after cessation of symptoms. If treated, then specimens must be collected at least 2 weeks after completion of antibiotic treatment.                     |
| Health care, nursery or other staff who have contact with susceptible persons | Exclude until 3 consecutive stool samples are negative. They are to be collected one week apart and at least 24 hrs after cessation of symptoms. If treated, then specimens must be collected at least 2 weeks after completion of antibiotic treatment.                     |
| Children less than 5 years old attending daycare etc                          | Exclude until 3 consecutive stool samples are negative. They are to be collected one week apart and at least 24 hrs after cessation of symptoms. If treated, then specimens must be collected at least 2 weeks after completion of antibiotic treatment.                     |
| Case contacts who are in special risk groups                                  | <p><i>Symptomatic:</i> Exclude and have stool samples cultured for confirmation. If positive, handle as a case. If negative, exclude until symptoms have cleared and stools are well formed.</p> <p><i>Asymptomatic:</i> This must be evaluated on a case by case basis.</p> |

|                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Health Education</b>                                   | <ul style="list-style-type: none"> <li>• Provide public education about personal hygiene, especially the sanitary disposal of feces and careful hand washing after defecation and sexual contact, and before preparing or eating food.</li> <li>• Educate food handlers about proper food and equipment handling and hygiene, especially in avoiding cross-contamination from raw meat products, time-temperature standards, and thorough hand washing.</li> <li>• Advise infected individuals to avoid food preparation.</li> <li>• Educate about the risk of sexual practices that permit fecal-oral contact.</li> <li>• Educate about condom use for safer sex.</li> <li>• Educate about the dangers of consuming raw or unpasteurized milk or other dairy products.</li> <li>• Educate about the dangers of consuming undercooked meat, poultry, and eggs (including foods in which raw eggs are present).</li> <li>• Consult with the healthcare provider regarding Typhoid occurrence and vaccination recommendations. Routine typhoid immunization is not recommended in Canada. However, selective immunization should be considered in the following groups: <ul style="list-style-type: none"> <li>o Travelers who will have prolonged (more than 4 weeks) exposure to potentially contaminated food and water, especially those travelling to or working in small cities, villages or rural areas in countries with a high incidence of disease.</li> <li>o Travelers with reduced or absent gastric acid secretion.</li> <li>o People with ongoing household or intimate exposure to an <i>S. typhi</i> carrier.</li> </ul> </li> <li>• Typhoid vaccine does not confer complete protection against disease, and immunity may be overwhelmed by a large inoculum of <i>S. typhi</i>. Therefore, it is necessary to warn travelers that immunization is only an additional preventive measure against Typhoid Fever in high-risk situations and that care in the selection of food and water remains of primary importance.</li> </ul> |

## 4.17.1 *Escherichia coli* (Verotoxigenic)

### Special Precautions/Considerations

Precautions: Routine and Contact if incontinent

#### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Infectious Agent</b>      | Verotoxigenic <i>Escherichia coli</i> (VTEC) comprise a wide range of serotypes that produce a variety of closely related verotoxins, of which <i>E. coli</i> O157:H7 is the most commonly associated with infection in humans.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Clinical Presentation</b> | Diarrhea often beginning as non-bloody progressing to visible or occult blood, severe abdominal pain, vomiting; fever is not present in most cases and symptoms usually last fewer than 5 days. Most of those infected recover without residual sequelae; however, illness may be complicated by hemolytic uremic syndrome (HUS), thrombocytopenic purpura (TPP) or pulmonary edema. Asymptomatic infections may also occur and the microorganism may cause extra-intestinal infections.                                                                                                                                                                                                                                                                                                        |
| <b>Diagnostics</b>           | The diagnosis is confirmed by isolation of the bacteria from stool, urine or blood. The diagnosis of <i>E. coli</i> should be considered in the presence of severe diarrhea, HUS, TTP or hemorrhagic colitis.<br><br>Follow your regional laboratory procedures.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Treatment</b>             | Treatment is supportive; fluid and electrolyte replacement when diarrhea is watery. The role of antibiotics is uncertain, however, some evidence suggests that treatment with TMP-SMX fluoroquinolones may precipitate complications such as HUS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Occurrence</b>            | <b>Worldwide:</b> The diarrheal illness was first recognized in the United States in 1982. Since that time it has become an important concern in North America, Europe, South Africa, Japan, the southern cone of South America, and Australia. The highest age-specific incidence rates occur in children under the age of 15 years, although all age ranges are susceptible.<br><br><b>Canada:</b> Sporadic cases and outbreaks have occurred in Canada. According to the National Enteric Surveillance Program (NESP), the incidence rates of <i>E. coli</i> from 2002 to 2012 show a downward trend. For example, the number of cases of <i>E. coli</i> O157 in 2012 was approximately half that reported in 2006.<br><br><b>Nunavut:</b> There have been no reported cases from 2007–2011. |
| <b>Reservoir</b>             | The most important reservoir is infected dairy and beef cattle, but other animals such as sheep, pigs and goats can also be infected. Humans may serve as a reservoir for person-to-person spread, which can be common in outbreaks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Transmission</b>          | Transmission by the fecal-oral route mainly by ingestion of contaminated food. Ground beef is a common source of infection but other known sources include raw milk, raw milk cheese, fresh produce such as spinach and lettuce, sprouts, melons and unpasteurized apple cider or juices.<br><br>Waterborne transmission can occur through the ingestion of contaminated drinking or recreational water.<br><br>Animal-to-person transmission can occur at farms and petting zoos.<br><br>Person-to-person transmission most frequently occurs in settings where personal hygiene practices are inadequate.                                                                                                                                                                                     |

|                                      |                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Incubation Period</b>             | Two to 10 days with a median incubation period of 3 to 4 days. HUS may develop up to 2 weeks after the onset of diarrhea.                                                                                                                                                                                                                   |
| <b>Communicability</b>               | Variable, as long as organisms are excreted. The duration of excretion of the pathogen is typically one week or less in adults but can be as long as 3 weeks in one third of children. Prolonged carriage is uncommon.                                                                                                                      |
| <b>Susceptibility and Resistance</b> | The infectious dose is very low. Little is known about differences in susceptibility and immunity, but infections occur in persons of all ages. Children under five years of age are most frequently diagnosed with infection and are at greatest risk of developing HUS. The elderly also appear to be at increased risk of complications. |

## Public Health Management

| <b>Case</b>                                                                   | <p>Confirm the diagnosis – ensure that all suspect cases receive prompt investigative procedures to confirm the case. Contact and interview the case, parent or guardian. Complete the <a href="#">Food and Waterborne Illness Investigation Form</a> dated March 2014 or later.</p> <p>Investigate cases of <i>E. coli</i> to determine the source of infection, being sure to obtain the following disease-specific information:</p> <ul style="list-style-type: none"> <li>• History of exposure to possible sources (see Transmission section).</li> <li>• Food and water history in the past 7 days.</li> <li>• History of recent (international) travel.</li> </ul> <p>Obtain and test suspected food products and remove from consumption to avoid further exposure.</p> <p>All cases should be instructed about disease transmission, appropriate personal hygiene, routine practices, and contact precautions.</p> <p>Determine if case is a food handler, a health care provider or staff of a childcare (daycare) facility. Exclusion is at the discretion of the Chief Medical Officer of Health (CMOH)/Deputy CMOH. Consult with the Environmental Health Officer (EHO) regarding exclusion criteria described below:</p> <table border="1"> <thead> <tr> <th>Risk Group</th><th>Criteria for Exclusion</th></tr> </thead> <tbody> <tr> <td>Food Handlers</td><td>Exclude until 2 negative stool samples have been obtained at least 24 hrs apart or 48 hrs after the completion of antibiotic therapy and symptoms have cleared.</td></tr> <tr> <td>Health care, nursery or other staff who have contact with susceptible persons</td><td>Exclude until 2 negative stool samples have been obtained at least 24 hrs apart or 48 hrs after the completion of antibiotic therapy and symptoms have cleared.</td></tr> <tr> <td>Children less than 5 years old attending daycare etc</td><td>Exclude until 2 negative stool samples have been obtained at least 24 hrs apart or 48 hrs after the completion of antibiotic therapy and symptoms have cleared.</td></tr> <tr> <td>Case contacts who are in special risk groups</td><td>Symptomatic Exclude and have stool samples cultured for confirmation. If positive, handle as a case. If negative, exclude until symptoms have cleared and stools are well formed.<br/>Asymptomatic: This must be evaluated on a case by case basis.</td></tr> </tbody> </table> | Risk Group | Criteria for Exclusion | Food Handlers | Exclude until 2 negative stool samples have been obtained at least 24 hrs apart or 48 hrs after the completion of antibiotic therapy and symptoms have cleared. | Health care, nursery or other staff who have contact with susceptible persons | Exclude until 2 negative stool samples have been obtained at least 24 hrs apart or 48 hrs after the completion of antibiotic therapy and symptoms have cleared. | Children less than 5 years old attending daycare etc | Exclude until 2 negative stool samples have been obtained at least 24 hrs apart or 48 hrs after the completion of antibiotic therapy and symptoms have cleared. | Case contacts who are in special risk groups | Symptomatic Exclude and have stool samples cultured for confirmation. If positive, handle as a case. If negative, exclude until symptoms have cleared and stools are well formed.<br>Asymptomatic: This must be evaluated on a case by case basis. |

| <b>Infectious Agent</b>      | Yersiniosis is caused by a gram-negative bacterium. Two species, <i>Yersinia enterocolitica</i> (most common in Canada) and <i>Yersinia pseudotuberculosis</i> are the causative agents of Yersiniosis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Clinical Presentation</b> | <p>Yersiniosis is an acute bacterial enteric disease with a variety of presentations. Enterocolitis occurs in approximately two-thirds of reported cases of <i>Y. enterocolitica</i>. Infection is characterized by fever, diarrhea, and abdominal pain lasting 1-3 weeks. Nausea and vomiting occur in up to 40% of cases. Many cases are misdiagnosed as acute appendicitis.</p> <p>The most common manifestation of <i>Y. pseudotuberculosis</i> infection is mesenteric adenitis causing acute appendicitis-like syndrome. The infection is usually self-limited. Mesenteric adenitis occurs primarily in older children and young adults. Infection with <i>Y. pseudotuberculosis</i> has a higher case-fatality rate in immunocompromised individuals.</p> <p>Complications of infection with <i>Yersinia</i> include polyarthrititis, erythema nodosum, exudative pharyngitis, and septicemia. Focal infections, abscess formation, and bacteremia may occur in individuals with predisposing conditions.</p> <p>In cases related to blood transfusion, fever and rigors may occur within 30 minutes of the transfusion and may rapidly progress to hypotension, disseminated intravascular coagulation, renal failure, and death.</p> |
| <b>Diagnostics</b>           | <p><i>Yersinia</i> can be recovered from feces, throat swabs, mesenteric lymph nodes, peritoneal fluid, blood, vomit, and contaminated food. Stool cultures are generally positive during the first two weeks of illness. It is important that laboratories be notified that <i>Yersinia</i> infection is suspected as identification from stool specimens requires specific techniques.</p> <p>Serology may be utilized as there can be difficulties in isolating <i>Yersinia</i> from feces. ELISA and agglutination tests may be ordered. Antibodies appear soon after the onset of illness and wane over 2-6 months. Paired sera specimens taken two weeks apart indicating a rise in agglutinating antibodies can support the diagnosis.</p> <p>Follow your regional laboratory procedures for testing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Treatment</b>             | <p>Treatment is under the direction of the attending healthcare provider.</p> <p>Yersiniosis is often self-limited. Antibiotics may shorten the duration of symptoms and are especially important for septicemia or other invasive disease.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Occurrence</b>            | <b>Worldwide:</b> Worldwide occurrence. The highest rates are reported in cooler climates and occur more often in winter than summer. Yersiniosis is a common                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                      | <p>disease in Northern Europe, Scandinavia, and Japan. The majority of cases are related to the ingestion of raw or undercooked pork or pork products. Approximately 65% of <i>Y. enterocolitica</i> infections occur in infants and young children.</p> <p><b>Canada:</b> Yersiniosis is an uncommon source of diarrhea and abdominal pain in Canada. The number of cases is unknown as Yersiniosis is not a nationally notifiable disease.</p> <p><b>Nunavut:</b> There have been no reported cases from 2007–2011.</p> |
| <b>Reservoir</b>                     | Animals. Pigs are the main reservoir for <i>Y. enterocolitica</i> . <i>Y. pseudotuberculosis</i> is widespread among avian and mammalian hosts, particularly rodents and other small mammals.                                                                                                                                                                                                                                                                                                                             |
| <b>Transmission</b>                  | Fecal-oral transmission through consumption of contaminated food or water or through contact with infected people or animals. <i>Y. enterocolitica</i> infection is most often associated with undercooked meat and pork products. Transfusion with blood from asymptomatic donors is also possible.                                                                                                                                                                                                                      |
| <b>Incubation Period</b>             | The incubation period is most often 3-7 days, generally less than 10 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Communicability</b>               | Secondary transmission appears rare. Fecal shedding occurs as long as symptoms persist; usually 2-3 weeks. If untreated, individuals may shed for 2-3 months; prolonged asymptomatic carriage has been reported.                                                                                                                                                                                                                                                                                                          |
| <b>Susceptibility and Resistance</b> | Universal susceptibility. The infection is generally more severe in children. The most susceptible populations for disease and possible complications are the very young, the very old and immunocompromised individuals.                                                                                                                                                                                                                                                                                                 |

## Public Health Management

| <b>Case</b>                                                                   | <p>Confirm the diagnosis – ensure that all suspect cases receive prompt investigative procedures to confirm the case. Contact and interview the case, parent or guardian. Complete the <b><i>Food and Waterborne Illness Report Form</i></b> dated March 2014 or later (section 4.18.2).</p> <p>Investigate cases to determine the source of infection, being sure to obtain the following disease-specific information:</p> <ul style="list-style-type: none"> <li>• Food and water history (retain all suspected food or water for laboratory analysis based on Environmental Health Officer [EHO] direction).</li> <li>• History of out of territory or international travel.</li> <li>• History of similar illness in household members.</li> </ul> <p>Cases should be instructed about disease transmission and prevention.</p> <p>Exclusion is at the discretion of the Chief Medical Officer of Health (CMOH)/Deputy CMOH. Exclusion may be considered for symptomatic persons; consult with the EHO regarding exclusion criteria described below:</p> <table border="1"> <thead> <tr> <th>Risk Group</th><th>Criteria for Exclusion</th></tr> </thead> <tbody> <tr> <td>Food Handlers</td><td>Exclude until asymptomatic for 24 hrs or 48 hrs after completion of antibiotic treatment.</td></tr> <tr> <td>Health care, nursery or other staff who have contact with susceptible persons</td><td>Exclude until asymptomatic for 24 hrs or 48 hrs after completion of antibiotic treatment.</td></tr> <tr> <td>Children less than 5 years old attending daycare etc.</td><td>Exclude until asymptomatic for 24 hrs or 48 hrs after completion of antibiotic treatment.</td></tr> </tbody> </table> | Risk Group | Criteria for Exclusion | Food Handlers | Exclude until asymptomatic for 24 hrs or 48 hrs after completion of antibiotic treatment. | Health care, nursery or other staff who have contact with susceptible persons | Exclude until asymptomatic for 24 hrs or 48 hrs after completion of antibiotic treatment. | Children less than 5 years old attending daycare etc. | Exclude until asymptomatic for 24 hrs or 48 hrs after completion of antibiotic treatment. |

| <b>Approval</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Approved by Dr. Maureen Baikie, Chief Medical Officer of Health on September 18, 2015.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 5.0 Bloodborne Infections

### Purpose

The purpose of this section of the Communicable Disease Manual is to provide guidelines for the investigation and management of individuals who have been diagnosed with notifiable bloodborne infections, including Acquired Immunodeficiency Syndrome (AIDS), Hepatitis B, Hepatitis C, Human Immunodeficiency Virus (HIV), Human T-Cell Lymphotropic Virus, as well as exposure to blood and body fluids.

### Legislation/Policy

Authority for the reporting of notifiable bloodborne infections and their public health management comes from the *Public Health Act, Communicable Disease Regulations*.

All clients who have been diagnosed with notifiable bloodborne infections must be reported to the Chief Medical Officer of Health (CMOH).

All clients who are suspected to have or have a confirmed notifiable bloodborne infection are to be followed as per the protocols in this section.

### Roles and Responsibilities

**Table 5.1: Roles and responsibilities for follow up of notifiable bloodborne infections**

| Role                                                                                                      | Responsibilities                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Infectious Agent</b>      | Human immunodeficiency virus (HIV-1 and HIV-2), a retrovirus. HIV-1 is the predominant strain in Canada and worldwide.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Clinical Presentation</b> | <p>80-90% of HIV infected people develop a flu-like illness within 4 to 8 weeks after exposure to the virus. This non-specific flu-like illness may include recurring fever or profuse night sweats, fatigue, arthralgia or myalgia, headaches, malaise, rash, pharyngitis, oral or genital ulcers, weight loss, nausea, vomiting or diarrhea or lymphadenopathy. These symptoms usually disappear within a week to a month and are often mistaken for those of another viral infection. Persons are then asymptomatic for months to years.</p> <p>AIDS is advanced HIV-related disease. This syndrome represents the late clinical stage of HIV infection resulting from progressive damage to the immune system, leading to one or more of many opportunistic infections and cancers (see Case Definition section).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Diagnostics</b>           | <p>Serological testing for HIV-1 and HIV-2 is done using a commercial EIA test kit as the initial screening test. All positive EIA test results are confirmed by an HIV-1 Western blot (WB), a specific test. A negative confirmatory HIV WB test negates the initial reactive EIA, and is reported as negative. A positive WB supports the initial reactive EIA, and is reported as positive. An indeterminate WB result cannot be interpreted as either negative or positive and requires repeat and possibly supplementary testing, the latter guided by risk factors for HIV infection. Any unusual results should be discussed with the Chief Medical Officer of Health (CMOH).</p> <p>Occasionally, an individual may be in the window period of HIV infection with a negative EIA, or a negative/indeterminate WB. Rarely, infection with HIV-2 may explain a positive EIA and negative/indeterminate WB. Consultation with the laboratory or infectious diseases specialist is warranted if such clinical scenarios are identified.</p> <p>Detection of HIV nucleic acid (e.g., DNA PCR or Plasma RNA) can facilitate an HIV diagnosis. In infants less than 18 months of age born to HIV-infected mothers, testing should be done within two weeks after birth and, if negative, repeated at 1 to 2 months and at 3 to 4 months of age. All positive results should be repeated with a second specimen for confirmation. Consult with an expert in HIV in children.</p> <p>The "window period" for HIV antibody development in non-immunocompromised hosts is usually less than a month with the current generation of screening tests. However, antibody development may be delayed if the subject is immunocompromised, or is co-infected with Hepatitis C.</p> <p>Follow your regional laboratory procedures for serologic testing.</p> |
| <b>Treatment</b>             | Consult with a specialist for the latest and most appropriate treatment recommendations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Pathogen                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Occurrence                    | <p><b>Worldwide:</b> AIDS was first recognized in 1981; and has been documented in virtually all countries of the world, among all races, ages, and social classes.</p> <p><b>Canada:</b> AIDS in Canada was first recognized in the early 1980s, and testing programs became available in 1985. The distribution of HIV cases by exposure category and sex has changed over the years. When HIV reporting began in 1985, men having sex with men (MSM) accounted for over 80% of all positive test reports. This percentage has diminished significantly since that time. The proportion of new infections among heterosexuals, injection drug users (IDUs) and women has increased steadily over the last two decades. Aboriginal persons (including Inuit, Métis and First Nations) are over-represented among the total of new HIV cases.</p> <p><b>Nunavut:</b> There have been 2 reported cases in Nunavut since 1999.</p>                                                                      |
| Reservoir                     | Humans.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Transmission                  | <p>The HIV virus, which leads to AIDS, is transmitted from person to person. Possible routes of transmission include:</p> <ul style="list-style-type: none"> <li>• Sexual contact with an HIV infected person;</li> <li>• Contact of abraded skin or mucosa with body secretions such as blood, CSF or semen;</li> <li>• Percutaneous exposure to an HIV contaminated implement (injection drug use paraphernalia, needle stick puncture, razors, body modification, etc);</li> <li>• Perinatal transmission from an HIV infected mother;</li> <li>• Transfusion, transplantation or ingestion of HIV contaminated blood, blood products, cells, organs, tissues or breast milk.</li> </ul> <p>The presence of a concurrent sexually transmitted infection, especially an ulcerative one, can facilitate HIV transmission.</p> <p>While HIV has occasionally been found in saliva, tears, urine and bronchial secretions, transmission after contact with these secretions has not been reported.</p> |
| Incubation Period             | Variable; antibodies can typically be detected in the blood 3 to 6 weeks from initial infection (usually 1 to 3 months). The time from HIV infection to diagnosis of AIDS has an observed range of less than one year to 15 years or longer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Communicability               | Epidemiological evidence suggests that transmissibility begins early after the onset of HIV infection and extends throughout life. Infectiousness is highest during the initial infection, and rises with increasing immune deficiency. The presence of other Sexually Transmitted Infections (STIs), especially ulcerative STIs increases the likelihood of transmission.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Susceptibility and Resistance | Susceptibility is presumed to be general. Absence of male circumcision and the presence of STI, especially those with ulcerations, increases susceptibility to HIV. Individuals who are co-infected with <i>M. tuberculosis</i> and HIV develop active TB at an increased rate, especially as individuals become immunocompromised due to HIV.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Public Health Management

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Approved by Dr. Maureen Baikie, Chief Medical Officer of Health on April 9, 2014.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## **5.2 Protocol for the Management of Exposures to Blood and Body Fluids**

5.2.1 Purpose

5.2.2 Policy

5.2.3 Roles and Responsibilities

5.2.4 Protocol for the Management of Blood and Body Fluid Exposures (step-by-step guidance)

5.2.5 Resources

5.2.6 References

**Appendix A:** Workers' Safety and Compensation Commission

**Appendix B:** Patient information on anti-retrovirals for HIV

**Appendix C:** Post-Exposure Follow up Record for Exposed Clients

**Form:** [Exposure to Blood and Body Fluids Case Report & Worksheet for Consultation](#)

### 5.2.1 Purpose

To provide a guideline for the investigation and management of individuals who have occupational or accidental percutaneous or mucosal exposure to blood or body fluids from a person who may have Hepatitis B (HBV), Hepatitis C (HCV) or Human Immunodeficiency Virus (HIV).

### 2.0 Policy

Any health care worker (HCW) having significant exposure to human blood or body fluids shall report the incident to their immediate supervisor who will arrange a clinical assessment and follow-up and ensure an incident report is filed.

A community client reporting direct exposure to human blood and body fluids should have a clinical assessment and follow-up using this protocol.

Exposed HCWs and community clients are hereafter referred to as *the Exposed*.

The Regional Communicable Disease Coordinator (RCDC) is available for consultation as required. The RCDC will consult with the Territorial Communicable Disease Consultant and Medical Officer of Health (MOH). After hours the MOH on call can be contacted.

### 3.0 Roles and Responsibilities

**Note: If the exposure is work-related, the Workers' Safety and Compensation Commission (WSCC) must be involved. Please refer to Appendix A in addition to the guidelines below.**

**Table 1: Roles and responsibilities for exposure to blood borne pathogens**

| Role                                                                                                                                  | Responsibilities                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

#### **4.0 Protocol for the Management of Exposure to Blood and Body Fluid Exposures (Step by Step Guidance)**

Follow the steps outlined below regarding the *Exposed* to determine the risk of transmission of a blood borne pathogen and to manage the exposure accordingly.

Consult with the RCDC or MOH as required.

**Note:** Use *Nunavut Exposure to Blood and Body Fluids Case Report & Worksheet for Consultation* to document the risk assessment and management (see Appendix D). Send this form to the RCDC for consultation when required. If the exposure is work-related fill in the appropriate WSCC form as required (<http://www.wcb.nt.ca/Workers/Forms/Pages/default.aspx>).

##### **Step 1: Treat the exposed area immediately**

- Allow immediate bleeding of the wound
- Wash with soap and water any wounds or skin sites that have been in contact with blood or body fluids
- Flush exposed eyes or mucous membranes with copious amounts of water or normal saline
- Check Td and Hepatitis B vaccine status\*

\* Tetanus is not bloodborne but consider every blood and body fluid exposure as an opportunity to update tetanus immunization as per the schedule in the Nunavut Immunization Manual

##### **Step 2: Assess the risk by answering the questions below:**

Take the following points into account when assessing the risk:

- A significant exposure is when one person's blood or other high risk body fluid comes in contact with someone else's blood, through exposure to subcutaneous tissue, non-intact chapped or abraded skin or mucous membrane
- The risk varies by pathogen and site of exposure

**Table 2: Risk of Acquiring infection from an infected source**

|            | <b>Risk of acquiring from percutaneous exposure when source is infected</b>             | <b>Risk of acquiring from mucosal exposure</b> | <b>Comments</b>                                                                                                                                                                                                                                                                       |
|------------|-----------------------------------------------------------------------------------------|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>HBV</b> | Ranges from 23% (HBeAg negative <i>Source</i> ) to 62% (HBeAg positive <i>Source</i> ). |                                                | HBV can live for one week in dried blood <sup>1</sup>                                                                                                                                                                                                                                 |
| <b>HCV</b> | The average risk is 1.8%.                                                               | Rarely from mucous membrane exposures to blood | No transmission has been documented from intact or non-intact skin exposures to blood. Data are limited on the survival of HCV in the environment, however environmental contamination with HCV infected blood is not believed to be a significant risk for transmission <sup>1</sup> |
| <b>HIV</b> | Average risk is 0.3% <sup>1</sup>                                                       | Average risk is 0.1% <sup>1</sup>              |                                                                                                                                                                                                                                                                                       |

**a) What is the nature of the injury?**

The mechanism or route of injury may include:

- Parenteral injection (needle-stick or cut with potentially contaminated sharps)
- Splash to mucous membrane of eyes, nose or mouth
- Non-intact skin exposure
- Human bites resulting in blood exposure to either person involved (both the *Source* and the *Exposed* are considered to be at risk)

**Note:** Exposure on intact skin does **not** pose a risk for infection with a blood borne pathogen.

**b) What type of body fluid was involved?**

Body fluids at risk of transmitting HBV, HCV, and HIV from an infected individual in a community setting or health care facility are outlined in Table 3.

**Table 3: Transmission of HBV, HCV and HIV by select body fluids and tissues**

| Fluid/tissue                                                                                | HBV                                                        | HCV                                                        | HIV                                        |
|---------------------------------------------------------------------------------------------|------------------------------------------------------------|------------------------------------------------------------|--------------------------------------------|
| Blood and fluids visibly contaminated with blood                                            | Yes                                                        | Yes                                                        | Yes                                        |
| Semen                                                                                       | Yes                                                        | Rare                                                       | Yes                                        |
| Vaginal secretions                                                                          | Yes                                                        | Rare                                                       | Yes                                        |
| Pleural, amniotic, pericardial, synovial and cerebrospinal fluids and inflammatory exudates | Yes                                                        | Yes                                                        | Yes                                        |
| Saliva                                                                                      | Yes                                                        | If contaminated with blood                                 | If contaminated with blood                 |
| Transplanted tissues or organs                                                              | Yes                                                        | Yes                                                        | Yes                                        |
| Breast milk                                                                                 | Plausible, particularly if nipples are cracked or bleeding | Plausible, particularly if nipples are cracked or bleeding | Yes                                        |
| Feces, nasal secretions, sputum, sweat, tears, urine, vomitus                               | No, unless visibly contaminated with blood                 | No, unless visibly contaminated with blood                 | No, unless visibly contaminated with blood |

**c) Is the infectious status of the source person known (hereafter referred to as the *Source*)?**

- Is the Source infected with HBV, HCV or HIV?
- If the status of the source is unknown, is there increased risk of transmission from the *Source* to the *Exposed*? Increased risk includes
  - o high-risk sexual behavior
  - o injection drug use
  - o diagnosis of other sexually transmitted disease(s)
  - o blood contact with a known case of HIV infection
  - o emigration from an HBV, HCV, and/or HIV-endemic country
  - o tattoo, body piercing, electrolysis, acupuncture
  - o history of dialysis
  - o history of multiple blood transfusions of blood or blood products prior to January 1972
  - o history of receipt of blood-derived coagulation products before January 1972
  - o history of receipt of IV immunoglobulin products prior to 1997
- The risk from a found sharp depends on the circumstances

**d) Is the *Exposed* susceptible ?**

- Is the *Exposed* already infected with HBV, HCV or HIV?
- Has the *Exposed* been immunized against HBV? If yes, is their immune (anti-HBs) status known?

**Step 3: Order testing for the *Exposed* or the *Source* (if known) based on the answers to the questions in Step 2.**

Testing to be done, unless already known to be positive

| Disease | Source tests required | Exposed tests required |
|---------|-----------------------|------------------------|
| HBV     | HbsAg<br>Anti-Hbs,    | HbsAg<br>Anti-Hbs,     |
| HCV     | Anti-HCV              | Anti-HCV               |
| HIV     | HIV                   | HIV                    |

Note that:

- Testing is **voluntary** for both the *Exposed* and the *Source*
- Test results may not be available quickly. Decisions will have to be made on clinical judgment in the meantime
- Pre-test counseling must be done for both the *Exposed* and the *Source*
- If the *Exposed* refuses to be tested, testing of the *Source* is usually not done
- If the *Source* refuses testing proceed with testing the *Exposed*
- Request consent from the *Source* to make the results known to both the *Exposed* and their health care provider. Document the consent

**Step 4: Manage the exposure based on the risk assessment**

**Note:** Hepatitis B vaccine is available in every Community Health Center. Hepatitis B immune globulin (HBIG) is available from the regional laboratory as it is a blood product.

Management of the exposure is based on the immunization and antibody status of the *Exposed* as well as the status of the *Source*.

Note that if the *Source* status is unknown, review the information known about the *Source* and the local epidemiology to assess if the *Source* is considered high risk or low risk for HBV infection.

**Hepatitis B (HBV) only**

**a) *Source* is HBsAg positive or high risk**

*Source* is HBsAg positive or high risk and the *Exposed* is either vaccinated or unvaccinated, see Canadian Immunization Guide; Part IV, Active Vaccines, Hepatitis B Vaccine, Recommendations for use, Post exposure immunization.

**b) *Source* is HBAg negative or low risk**

*Source* is uninfected or at low risk, see Canadian Immunization Guide; Part IV, Active Vaccines, Hepatitis B Vaccine, Recommendations for use Post exposure immunization.

**Refer to the Nunavut Immunization Manual for details on Hepatitis B vaccine and Hepatitis B Immune globulin.**

### c) Hepatitis C (HCV)

Effective post exposure prophylaxis for HCV is **not available** and immunoglobulin is **not effective**.

### d) HIV

The Department of Health in Nunavut has an arrangement with the BC Centre for Excellence in HIV/AIDS whereby a physician or community nurse can call the Centre on a 24/7 basis to get expert advice on the risk of HIV from a blood or body fluid exposure including on the use of anti-retrovirals for post-exposure prophylaxis (PEP) to assist with urgent decisions regarding use of PEP.

- The number to call is 1-604-806-8429
  - Each Community Health Centre and Hospital in Nunavut has antiretroviral drugs that are consistent with the recommendations from the BC Centre for Excellence in HIV/AIDS
- HIV PEP should be initiated preferably within 2 hours of exposure for maximal efficacy. However, implementation of PEP for up to 72 hours post exposure can be considered.

|                                                        |
|--------------------------------------------------------|
| BC Centre for Excellence in HIV/AIDS<br>1-604-806-8429 |
|--------------------------------------------------------|

### **Step 5: Counsel the *Exposed* about follow up testing and precautions**

- Provide assurance that all test results will be treated in a strictly confidential manner
- Advise the *Exposed* about the need for medical follow-up for the next six months as per the following Table and depending on their current testing results.

| Time interval | Test            |
|---------------|-----------------|
| 6 weeks       | HCV and HIV     |
| 3 months      | HCV and HIV     |
| 6 months      | HCV HIV and HBV |

- Counsel the *Exposed* regarding the risks of infection after an exposure (refer to Step 2)
- Depending on initial tests results, advise the following:
  - o Use condoms with lubricant and/or dental dams with their partner(s) every time
  - o Delay pregnancy, or if pregnant at time of exposure consult a physician about the need for prophylactic therapies
  - o Consult regarding breastfeeding. The risk of transmission of HIV through breastfeeding is high for women who seroconvert while breastfeeding
  - o Do not donate blood, cells or tissues
  - o Do not share razors, toothbrushes or other personal care items that have the potential to be contaminated with blood or body fluids
  - o Do not share needles or injection drug use equipment
  - o Seek medical evaluation for any acute illness occurring during the post-exposure follow-up period

## Appendix A

### Workers' Safety and Compensation Commission (WSCC)

In all blood and body fluid exposures, the *Exposed* needs to be seen by a health care provider as soon as possible. This is essential to assess the nature of the exposure and to make decisions about the administration of prophylactic treatment.

**There are several important points to note if the exposure is work related:**

1. The health care provider needs to complete the form entitled "WSCC: First Medical Reporting Form".
2. The *Exposed* needs to complete the form entitled "WSCC Claim: Workers Report of Injury".
3. The occupational health practitioner or supervisor needs to ensure that the "WSCC Claim: Workers Report of Injury" form is completed. WSCC must receive this form within 72 hours of the incident.
4. The occupational health practitioner or supervisor must ensure that copies of the initial and follow-up serology for the *Exposed* are sent to WSCC at the time that results become available. Follow-up serology is conducted at 3 and 6 months post-exposure.
5. Note that if the serology results are not received by WSCC at the time of the incident (within 72 hours), and at 3 months and 6 months post-exposure, the claim will be closed.

These forms should be available in all health facilities in Nunavut. They are also available at the WSCC website at: <http://www.wcb.nt.ca/Workers/Forms/Pages/default.aspx>.

## 5.3.1 Hepatitis B

### Special Precautions/Considerations

Precautions: Routine

#### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

| Infectious Agent                 | Hepatitis B virus (HBV), a DNA virus. HBV is currently classified into 8 main genotypes (A-H).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                |                  |              |                  |              |                 |   |   |   |   |                   |   |   |   |   |                          |   |   |   |     |                           |   |    |   |     |                                  |   |    |   |     |

| Clinical                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                |                  |              |                  |              |                 |   |   |   |   |                   |   |   |   |   |                          |   |   |   |     |                           |   |    |   |     |                                  |   |    |   |     |
| Clinical Presentation            | <p>Acute HBV infection is often not clinically apparent, with 50-70% of adult cases being asymptomatic. Less than 10% of children and 30%-50% of adults with acute hepatitis B Virus infection show icteric disease. The onset of symptoms is usually gradual and subtle. Symptoms may include anorexia, fatigue, vague abdominal discomfort, nausea and vomiting, sometimes joint pain and rash often progressing to jaundice. Fever may be absent or mild. Severity ranges from asymptomatic cases detectable only by biochemical tests to fulminating cases of acute hepatic necrosis (rare).</p> <p>Chronic infection is characterized by persistence of HBsAG for more than 6 months. Persons with chronic HBV infection may have intermittent flares with symptoms and signs similar to those seen in acute infection. Patients with chronic HBV can progress to cirrhosis, liver failure, and hepatocellular carcinoma.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                |                  |              |                  |              |                 |   |   |   |   |                   |   |   |   |   |                          |   |   |   |     |                           |   |    |   |     |                                  |   |    |   |     |

| <b>Treatment</b>                     | Any patient with Hepatitis B (acute or chronic) should be referred to a physician for further management.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Occurrence</b>                    | <p><b>Worldwide:</b> Endemic with little seasonal variation. In highly endemic countries, most infections occur during infancy and early childhood. In low endemic countries infections occur mostly in young adults, especially those belonging to known risk groups (eg. persons using injection drugs, people who have multiple sex partners, men who have sex with men, household and sexual contacts of people with chronic HBV infection, health care workers and others who may be exposed to blood and blood products through their work, people interned in correctional facilities).</p> <p><b>Canada:</b> Prior to donor screening, blood and blood products were sources of infection in Canada and may still be in countries where the quality of the blood supply is questionable.</p> <p>Outbreaks have previously occurred linked to contaminated or inadequately sterilized needles and syringes; tattoo parlours and acupuncturists; transmission from infected health care workers; and in dialysis centres where infection control practices have not been adhered to.</p> <p>Incidence of acute HBV in Canada is estimated to be 2.3 per 100,000.</p> <p><b>Nunavut:</b> In a serologic study conducted between 1983 and 1985 that screened approximately 51% of the Inuit population of the Northwest Territories (prior to the creation of Nunavut), the overall prevalence rates for HBsAg and anti-HBs were 3.9% and 24.5%, respectively. New HBV infection is believed to be uncommon in Nunavut with the introduction of universal immunization, but accurate epidemiologic data are unavailable.</p> |
| <b>Reservoir</b>                     | Humans.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Transmission</b>                  | <p>Via blood, blood products, saliva, CSF, pleural, peritoneal, semen and vaginal secretions and any other fluid containing blood. Routes of transmission include:</p> <ul style="list-style-type: none"> <li>• Percutaneous (needle stick or injection drug use when equipment is shared);</li> <li>• Sexual (anal, vaginal, oral);</li> <li>• Close household contact with an infected person;</li> <li>• Perinatal mother-to-infant transmission.</li> </ul> <p>HBV is stable on environmental surfaces in blood for at least 7 days making indirect transmission from objects contaminated with infected blood possible.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Incubation Period</b>             | 45 to 160 days, average 120 days. It may be as short as 2 weeks to the appearance of HBsAg and rarely as long as 6-9 months. The variation is related in part to the amount of virus in the inoculum, the mode of transmission and host factors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Communicability</b>               | From several weeks before onset of first symptoms until infection is resolved. However, 5 to 10% of infected adults go on to carry the virus for life. Chronic infection occurs in 90% of infants infected at birth and 25 to 50% of children infected at age 1 to 5 years. Carriers are capable of transmitting the virus at any time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Susceptibility and Resistance</b> | All non-immune people are susceptible; disease presentation is usually milder in children and may be asymptomatic in infants. Protective immunity follows infection if anti-HBs develops and HBsAg is negative.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Public Health Management

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

# Hepatitis B Case Report Form

**Case Status:**

\* Do NOT send forms to territorial office unless this is a new case

**Fill in OR affix CASE addressograph here**

**Last Name:** \_\_\_\_\_

**First Name:** \_\_\_\_\_

**Sex:**    ☐ **Male**       ☐ **Female**       ☐ **Other**

**Date of Birth:**    \_\_\_\_ (DD) \_\_\_\_ (month) \_\_\_\_ (YYYY)

**Chart#:** \_\_\_\_\_

**Health Card #:** \_\_\_\_\_

**Community of Residence:** \_\_\_\_\_

|                                    |                                |                                |                                  |                                  |
|------------------------------------|--------------------------------|--------------------------------|----------------------------------|----------------------------------|
| <input type="checkbox"/> Initial   | ____(DD) ____ (MM) ____ (YYYY) | <input type="checkbox"/> Acute | <input type="checkbox"/> Chronic | <input type="checkbox"/> Unknown |
| <input type="checkbox"/> Follow-up | ____(DD) ____ (MM) ____ (YYYY) | <input type="checkbox"/> Acute | <input type="checkbox"/> Chronic | <input type="checkbox"/> Unknown |
| <input type="checkbox"/> Final     | ____(DD) ____ (MM) ____ (YYYY) | <input type="checkbox"/> Acute | <input type="checkbox"/> Chronic | <input type="checkbox"/> Unknown |

### BOX 1.1 – DEMOGRAPHIC INFORMATION

**Origin** (check one box only, unless specified):

- ☐ Canadian Inuit      ☐ Canadian Non-Aboriginal      ☐ Foreign-born (*specify country of birth*): \_\_\_\_\_
- ☐ Canadian Métis      ☐ Other Aboriginal (*specify*): \_\_\_\_\_

### BOX 1.2 – REASONS FOR TESTING

Reason for testing (check all that apply):

- ☐ Symptomatic of Hepatitis B  
☐ Contact of a case  
☐ STI Screening  
☐ TB Screening  
☐ Other (*specify*): \_\_\_\_\_

### BOX 1.3 – CLINICAL INFORMATION

Hospitalized due to infection: ☐ Yes ☐ No ☐ Unknown

Previously tested positive: ☐ Yes ☐ No ☐ Unknown

If yes, report year \_\_\_\_\_

Location \_\_\_\_\_

### BOX 1.4 – SYMPTOMS

(Check all that apply)

| Symptom                                   | Onset Date (dd/mm/yyyy) |
|-------------------------------------------|-------------------------|
| <input type="checkbox"/> None             | N/A                     |
| <input type="checkbox"/> Anorexia         |                         |
| <input type="checkbox"/> Nausea           |                         |
| <input type="checkbox"/> Vomiting         |                         |
| <input type="checkbox"/> Abdominal Cramps |                         |
| <input type="checkbox"/> Fatigue          |                         |
| <input type="checkbox"/> Other (specify): |                         |

### BOX 1.5 – TESTING

|                                       | Initial Test                   |                                                                                                             | Follow-up Test                 |                                                                                                             |

| <b>Infectious Agent</b>      | Hepatitis C virus (HCV), a RNA virus with at least 6 existing genotypes. Genotype 1 predominates in Canada, but all types have been seen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Clinical Presentation</b> | <p>Most cases are usually asymptomatic or have mild illness. When symptoms are present, the onset is insidious and may include anorexia, vague abdominal discomfort, nausea, vomiting, fatigue and occasionally jaundice. HCV antibody seroconversion window period is approximately 5-10 weeks.</p> <p>Chronic HCV infection can be defined as continuing disease without improvement for at least 6 months. High percentages (50-80%) of infected persons develop chronic infection; chronic infections may present with disease flares and similar symptoms and signs. Of chronically infected persons 10-20% may eventually develop cirrhosis and 1-5% may develop hepatocellular carcinoma. Approximately 25% (range 15 to 45%) of HCV infections will resolve spontaneously.</p> |
| <b>Diagnostics</b>           | <p>Follow your regional laboratory procedures. Serologic testing (for anti-HCV) is commonly used to determine if a person is exposed to HCV. Note that a person who tests positive for anti-HCV will test positive for life and does not need to be retested for anti-HCV.</p> <p>Anti-HCV testing should not be performed in infants less than 18 months of age as the anti-HCV, if detected, may represent passive maternal antibody. As most infections occur at the time of childbirth, if testing for HCV RNA is considered, it should be delayed beyond 4 to 12 weeks to avoid false-negative HCV RNA test results. Cord blood should not be used because of potential cross-contamination with maternal antibody.</p>                                                           |
| <b>Treatment</b>             | Refer to physician for clinical follow-up.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Occurrence</b>            | <p><b>Worldwide:</b> It is estimated that approximately 3% of the world's population (or 180 million persons) are infected, 130 million of whom are chronic HCV carriers at risk of developing liver cirrhosis and/or liver cancer. In addition, it is estimated that three to four million people worldwide are newly infected with HCV each year.</p> <p><b>Canada:</b> The current risk for HCV transmission from blood transfusion is very low; all blood donations are screened by Canadian Blood Services for HCV.</p> <p><b>Nunavut:</b> HCV infection is present but accurate epidemiologic data are unavailable.</p>                                                                                                                                                          |
| <b>Reservoir</b>             | Humans.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Incubation Period</b>             | Usually 45-180 days, average 60-90 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Communicability</b>               | From one or more weeks before the onset of symptoms (if present); virus persists indefinitely in most persons without treatment. Cases testing PCR negative after treatment should still take steps to prevent transmission due to the remote possibility of transient viremia.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Susceptibility and Resistance</b> | Susceptibility is general. The degree of immunity following infection is unknown.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Infectious Agent</b>              | Human T-cell Lymphotropic Virus, Type 1 (HTLV-1). HTLV-1 is a retrovirus that infects t-cells. Most often it is asymptomatic but it does have disease associations as described below.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Clinical</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Clinical Presentation</b>         | <p>HTLV-1 is usually an asymptomatic infection; however there are two main disease associations that may occur in up to 5% of carriers:</p> <ol style="list-style-type: none"> <li>1. Adult T-cell leukemia/lymphoma (ATLL) develops in 2-5% of those infected.</li> <li>2. HTLV-1-associated myelopathy/tropical spastic paresis (HAM/TSP) develops up to 2% of carriers.</li> </ol> <p>Other associated conditions HTLV-1 include uveitis, infectious dermatitis in children and pulmonary and rheumatologic disorders.</p>                                                                                                                                                                     |
| <b>Diagnostics</b>                   | <p>Serologic testing is used to determine if a person is infected with HTLV-1. Follow your regional laboratory procedures.</p> <p>Once an individual is confirmed as being HTLV-1 positive repeated testing is not necessary.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Treatment</b>                     | There is no cure or treatment available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Occurrence</b>                    | <p><b>Worldwide:</b> HTLV-1 infections are endemic in southwest Japan, the Caribbean basin, Taiwan, sub-Saharan Africa, and areas of South and Central America. In certain parts of Japan, seroprevalence is higher than 30% of the adult population and increases with age.</p> <p><b>Canada:</b> HTLV-1 is rare in Canada. Canadian Blood Services has been screening donated blood for HTLV-1 since 1990 and reports an average of 10–12 positive tests per 800,000 donations annually (prevalence of 0.0014%).</p> <p><b>Nunavut:</b> HTLV-1 infection is present in Nunavut. The prevalence, based on a seroprevalence study from 2006, is estimated to be 3.1 per 1,000 people (0.31%).</p> |

| <b>Approval</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                     |
| Approved by Dr. Maureen Baikie, Chief Medical Officer of Health on December 16, 2013.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                     |

## 5.5.2 Managing HTLV-1 in Nunavut

### A Guide for Health Care Providers

In 2005 a cluster of cases of HTLV-1 infection were identified in Nunavut that resulted in the introduction of prenatal screening and clinical guidelines for infected individuals. In the past six years only 12 additional cases have been identified despite prenatal screening. The incidence in 2005 is felt to be an isolated cluster and as such prenatal screening is no longer recommended.

However, given the number of documented cases (n=40) in the territory, it is important that health care providers have sufficient knowledge of HTLV-1 to appropriately assess those patients with known HTLV-1 infection.

HTLV-1 is a retrovirus that can be transmitted through sexual contact, blood-to-blood contact and vertical transmission during prolonged breastfeeding. Infection is lifelong as there are no effective treatments.

The vast majority of individuals with HTLV-1 infection will be asymptomatic. However, there are two main disease associations that may occur in up to 5% of infected individuals.

- 1) Adult-t cell Leukemia-Lymphoma (ATL) – ATL occurs in 2-5% of those infected with HTLV-1. It typically presents 20-30 years after infection. Clinical features may include skin lesions, lytic bone lesions, pulmonary infiltrates, lymphadenopathy, hepatosplenomegaly and hypercalcemia. While limited treatment is available, prognosis is poor.

- 2) HTLV-1 associated myelopathy/tropical spastic paraparesis (HAM/TSP) – HAM/TSP occurs in up to 2% of HTLV-1 carriers. Onset is a median of 3 years after infection although it may present decades later. The illness is a progressive myelopathy of the lower limbs. Clinical features may include proximal lower limb weakness and spasticity, paresthesias, lumbar pain, urinary frequency, nocturia and incontinence. Corticosteroids may slow progression.

Other associated conditions include infective dermatitis in children, uveitis and rheumatologic and pulmonary disorders.

The Canadian Blood Services system routinely screens for the presence of HTLV-1 in donations to prevent transmission via blood transfusions. Other strategies to prevent transmission include using condoms, not sharing needles and avoiding prolonged breastfeeding by mothers known to be seropositive.

### 5.5.3 Clinical Guidelines for the Follow-Up of HTLV-1 Seropositive Individuals

Individuals who have been tested and found to be HTLV-1 positive should have the following clinical follow-up **every 12 months**. The history and physical exam should be directed to detect early findings suggestive of Adult T-cell Leukemia/ Lymphoma (ATL), and/or the neurological sequelae of HTLV-1 Associated Myelopathy (HAM).

#### On History:

- muscle weakness of the lower extremities
- paresthesias of the lower limbs
- urinary incontinence
- a change in chronic rash, or the onset of a new rash
- new onset of bony pain
- new lymphadenopathy
- depression screen

#### Physical Exam:

- testing of proximal muscle strength of the lower limb
- observation of gait
- testing of patellar DTR's assessing for hyper-reflexia
- testing for clonus
- a dermatologic exam
- palpation for lymphadenopathy
- examination for hepatosplenomegaly

#### Counselling:

- Condom use
- Discuss breastfeeding risks (if applicable)

#### Investigations

- CBC and  $\text{Ca}^{2+}$  every 12 months
- Biopsy of suspicious skin lesions
- LDH at initial visit and later if suspicious for malignancy
- HIV, syphilis, hepatitis C, screening initially and as indicated
- TB screening initially and as indicated

#### Referrals

- Early referral to internal medicine and/or hematology for any suspicion of leukemia/lymphoma based off exam findings or CBC
- Early referral to physiotherapy and neurology if any suspicion of HAM
- Early referral to mental health as indicated
- If pregnant or considering breastfeeding patients in the Qikiqtani region should be referred to a QGH obstetrics physician. Patients from the Kitikmeot and Kivalliq regions should discuss breastfeeding risks with a physician.

## 6.0 Sexually Transmitted Infections

### Purpose

The purpose of this section of the Communicable Disease Manual is to provide guidelines for the investigation and management of individuals who have been diagnosed with notifiable sexually transmitted infections (STIs) including Chancroid, Chlamydia, Gonorrhea and Syphilis. Note that HIV/AIDS and Hepatitis B infection can be transmitted through sexual contact but they are included in the section on Blood-Borne Infections.

### Legislation/Policy

Authority for the reporting of notifiable STIs and the public health management comes from the *Public Health Act, Communicable Disease Regulations*.

All clients who have been diagnosed with a notifiable STI must be reported to the Chief Medical Officer of Health (CMOH).

All clients who are suspected to have or have a confirmed notifiable STI are to be followed as per the protocol in this section.

### Roles and Responsibilities

**Table 6.1 Roles and responsibilities for follow-up of notifiable STIs**

| Role                                                                                         | Responsibilities                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Infectious Agent</b>      | <i>Haemophilus ducreyi</i> ( <i>H. ducreyi</i> ), a gram-negative coccobacillus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Clinical Presentation</b> | <p>An acute bacterial infection localized in the genital area and characterized clinically by single or multiple painful, necrotizing ulcers at the site of infection.</p> <p>The symptoms can be confused with Syphilis and a culture is needed to confirm diagnosis (however Chancroid tends to be very painful whereas Syphilis lesions are painless). Chancroid rarely spreads from the genital tract and does not cause systemic disease.</p>                                                                                                                                                                                                                                                                      |
| <b>Diagnostics</b>           | <p>Diagnosis is made based on the appearance of the ulcers/lymph nodes and laboratory testing of a sample of discharge or pus. This is generally made by excluding other infections that are associated with genital ulcer disease such as Herpes, Syphilis or Lymphogranuloma Venereum (LGV).</p> <p>Follow your regional laboratory procedures for specimen collection.</p>                                                                                                                                                                                                                                                                                                                                           |
| <b>Treatment</b>             | <p>Refer to the <i>Canadian Guidelines on Sexually Transmitted Infections</i> (January 2010 or current – <a href="http://www.phac-aspc.gc.ca/std-mts/sti-its/">http://www.phac-aspc.gc.ca/std-mts/sti-its/</a>).</p> <p>Buboes should be aspirated or incised to relieve pain and prevent spontaneous rupture. Consult with a physician.</p> <p>Asymptomatic carriage can occur.</p>                                                                                                                                                                                                                                                                                                                                    |
| <b>Pathogen</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Occurrence</b>            | <p><b>Worldwide:</b> Chancroid has been widespread in areas of the world where sexually transmitted infection (STI) control is inadequate. Vulnerable females (particularly sex workers with limited access to care) who have multiple partners in spite of genital ulceration are the usual reservoir. Chancroid can only remain endemic in this context. Reintroduction into societies in which Chancroid has been eliminated occasionally occurs with travel.</p> <p><b>Canada:</b> Rare. Outbreaks in the late 1970s and early 1980s occurred but numbers are generally low. Chancroid is not a nationally reportable infection.</p> <p><b>Nunavut:</b> Rare. There has been a single reported case since 2000.</p> |
| <b>Reservoir</b>             | Humans.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Transmission</b>          | Direct sexual contact with discharge from open lesions and pus from buboes. Autoinoculation to non-genital sites may occur in infected people. Nonsexual transmission is rare.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Incubation Period</b>     | 3 to 5 days, up to 14 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Communicability</b>       | The infection may be passed until lesions or buboes are healed. Without appropriate antibiotic treatment, the infectious agent may persist in the lesion or discharging lymph nodes for several weeks or months. Treatment with appropriate antibiotics eradicates <i>H. ducreyi</i> and lesions generally heal in one to three weeks.                                                                                                                                                                                                                                                                                                                                                                                  |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Susceptibility and Resistance</b> | Susceptibility is general; uncircumcised males are at higher risk than circumcised males. There is no evidence of natural resistance. Chancroid ulcers are associated with an increased risk of acquiring HIV.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Case</b>                          | <ul style="list-style-type: none"> <li>• Contact and interview the case. Cases should be interviewed for history of exposure, risk assessment, and sexual partner(s) identification.</li> <li>• If genital ulcers are present, test for Herpes, and consider testing for LGV and/or Granuloma Inguinale using the appropriate test medium.</li> <li>• Test for other concurrent STI infection (e.g. Gonorrhea, Chlamydia, Syphilis, HIV, Hepatitis B).</li> <li>• Immunization against Hepatitis B is recommended, if the vaccine series is not already complete.</li> <li>• All cases should be instructed about infection transmission.</li> <li>• Ensure the case receives appropriate antibiotic treatment as determined by the attending health care provider.</li> <li>• Identify all sexual partner(s) in the 2 weeks before symptom onset. Refer to the Contacts section below.</li> <li>• If Chancroid is diagnosed in children and youth under the age of 16, sexual abuse must be considered. The clinician should consult with a physician for testing and determine whether there are reasonable and probable grounds to believe the child or youth is in need of protection. Under Section 8-1 of the Child and Family Services Act, a person who has information of the need of protection of a child shall, without delay, report the matter to a Child Protection Worker or if not available to a peace officer or an authorized person.</li> </ul> |
| <b>Contacts</b>                      | <p>Partner notification will identify those at risk and reduce infection transmission and/or reinfection.</p> <ul style="list-style-type: none"> <li>• Every attempt should be made to identify, locate, examine and treat sexual partners/contacts of cases. <ul style="list-style-type: none"> <li>○ All contacts in the 2 weeks prior to symptom onset, regardless of signs or symptoms, must be located, tested and empirically treated regardless of clinical findings and without waiting for test results.</li> </ul> </li> <li>• The length of time for the trace-back period should be extended: <ul style="list-style-type: none"> <li>○ To include additional time up to the date of treatment;</li> <li>○ If the index case states that there were no partners during the recommended trace-back period, then the last partner should be notified;</li> <li>○ If all partners traced (according to recommended trace-back period) test negative, then the partner prior to the trace-back period should be notified.</li> </ul> </li> <li>• All contacts should be offered STI testing.</li> <li>• All contacts should be instructed about infection transmission.</li> <li>• Complete the <a href="#">STI Contact Investigation Form</a> dated September 2013 or later (section 6.1.3). Include additional pages for contact information as necessary.</li> </ul>                                                                                       |
| <b>Outbreaks</b>                     | If higher than normal disease activity is detected, contact your Regional Communicable Disease Coordinator (RCDC). <b>Note:</b> since Chancroid is rare, a single case would be considered above normal activity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Occurrence                                           | <p><b>Worldwide:</b> Chlamydia is one of the most frequently reported sexually transmitted infections (STIs) worldwide, with an estimated 92 million cases reported annually.</p> <p><b>Canada:</b> Chlamydia infections are the most commonly reported STI, accounting for more than three quarters of all reported STIs. Persons between the ages of 15 and 29 years typically represent the majority of reported cases. The national 2009 rate was 259 per 100,000.</p> <p><b>Nunavut:</b> The rate of Chlamydial infection has remained above the national average since reporting began in 1999. In 2011, the territorial Chlamydia rate was 3,922 per 100,000. Females 15 to 19 years old consistently have a higher rate than males and the highest of all age groups.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                   |                                    |                     |                       |                                                      |                                         |                         |                                    |                                  |                                                                                                                                   |  |               |                                             |                                                  |                         |

| Transmission                                         | Exchange of infected secretions during intimate contact via oral, vaginal, cervical, urethral or anal routes. Vaginal, oral and anal intercourse is the primary source of transmission; however newborns delivered vaginally by infected mothers are at risk and may develop conjunctivitis and pneumonia.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                   |                                    |                     |                       |                                                      |                                         |                         |                                    |                                  |                                                                                                                                   |  |               |                                             |                                                  |                         |
| Incubation Period                                    | Poorly defined; usual time from exposure to onset of symptoms is 2 to 3 weeks, but can be as long as 6 weeks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                   |                                    |                     |                       |                                                      |                                         |                         |                                    |                                  |                                                                                                                                   |  |               |                                             |                                                  |                         |
| Communicability                                      | Unknown; may extend for months or longer if untreated, especially in asymptomatic persons. Re-infections are common; individuals are advised to refrain from sexual contact until an effective course of antibiotic therapy is completed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                   |                                    |                     |                       |                                                      |                                         |                         |                                    |                                  |                                                                                                                                   |  |               |                                             |                                                  |                         |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Susceptibility and Resistance</b> | Susceptibility is general; the transmission probability of <i>C. trachomatis</i> has been estimated to be as high as 20% per genital sexual contact and is more efficient male-to-female than female-to-male. No acquired immunity has been demonstrated, although strain specific immunity probably exists.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                                                                                                                                                                                                                                                                                                                                                                                                                   | Pharyngeal and anorectal infections can occur in those engaging in oral and anal sex but are more likely to be asymptomatic. If the infection is located in the pharynx the individual may experience a sore throat and difficulty swallowing. For anorectal infections, there may be pain and discharge. If untreated, the bacteria may cause infection of the joints, skin, heart and brain. |                                                     |                    |

| A swab for gonorrhea culture is useful if antimicrobial resistance is suspected. Resistance results are not available with the urine test. If a pharyngeal or rectal swab is required, perform culture; however, note that since samples require lengthy transport in Nunavut the pathogen may not survive resulting in a false negative test. Results from culture should therefore be interpreted with caution. |                                                                                                                                                                                                                                                                                                                                                                                                |                                                     |                    |

|                                      | <p>cases are reported annually.</p> <p><b>Canada:</b> Gonorrhea rates in Canada have increased by 65.4% between 2010 and 2015. The highest rates were among those 15-29 years of age. The national Gonorrhea rate in 2015 was 55.4 per 100,000.</p> <p><b>Nunavut:</b> The rate of gonococcal infection has remained above the national average since reporting began in 1999. In 2013, the age-standardized rate was nearly 27 times higher than the rate for the rest of Canada. Gonorrhea was the second most frequently reported disease in Nunavut from 2007 to 2014; it accounted for about 25% of all STIs reported in the territory. Between 2007 and 2014 53% of the cases were female and 47% were male.</p>                                                                                                                                                                          |
| <b>Reservoir</b>                     | Humans.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Transmission</b>                  | <p>Transmission occurs by direct sexual contact via oral, vaginal, urethral, rectal or cervical routes. The bacteria may also spread from the primary sites, causing infection of the uterus (endometritis); the fallopian tubes (salpingitis); the abdominal cavity (peritonitis); the glands of the vulvar area (bartholinitis); and the testicles in men (epididymitis).</p> <p>Occasionally the infection can spread to infants if the mother is infected at the time of birth. Infection in the newborn usually involves the eye.</p>                                                                                                                                                                                                                                                                                                                                                      |
| <b>Incubation Period</b>             | Usually 2-7 days, sometimes longer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Communicability</b>               | The infection is communicable for as long as the bacteria are present in the body, even if the individual is asymptomatic. Effective treatment ends communicability.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Susceptibility and Resistance</b> | <p>Susceptibility is universal and re-infection is common. Co-infection with <i>Chlamydia trachomatis</i> is common.</p> <p>The proportion of penicillin-resistant organisms is greater than 1% in most areas of Canada and may reach 15% or higher in certain areas. Also, the numbers of isolates resistant to tetracyclines or a combination of penicillin and tetracyclines are still high, thus use of these antimicrobial agents is not routinely recommended.</p> <p>Quinolone resistance of the isolates tested by the National Microbiology Laboratory in Canada has been steadily increasing, from 1% in the late 1990s to 15.7% in 2005. Quinolones should only be considered as an alternative treatment if (1) antimicrobial susceptibility testing is available OR (2) if a Test of Cure is done.</p> <p>At present antibiotic resistance in gonorrhea in Nunavut is unknown.</p> |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Approved by Dr. Kim Barker Medical Officer of Health on April 15, 2018.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## **Nunavut Communicable Disease and Surveillance Manual:**

### **6.4 Syphilis**

#### **Contents**

- 6.4.1 Syphilis Public Health Protocol
- 6.4.2 Syphilis Report Form ( $\geq 2$  Years)
- 6.4.3 Syphilis Report Form for Infants ( $< 2$  Years)
- 6.4.4 Sexually Transmitted Infection Contact Investigation Form
- 6.4.5 Syphilis Decisional Support Tool
- 6.4.6 Syphilis Decisional Support Tool for Pregnancy and Infancy
- 6.4.7 Syphilis Contact Notification Letter 1
- 6.4.8 Syphilis Contact Notification Letter 2
- 6.4.9 Syphilis Contact Notification Letter 3
- 6.4.10 Fact Sheet: Syphilis

### 6.4.1 Syphilis

#### Special Precautions/Considerations

Precautions: Routine

\* if in contact with lesions use contact precautions

#### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Infectious Agent</b>              | <i>Treponema pallidum</i> ( <i>T. pallidum</i> ), a bacterium of the order spirochaeta.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Occurrence</b>                    | <p><b>Worldwide:</b> In developed countries, syphilis is usually more prevalent in urban than rural areas and in some cultures, in males more than in females.</p> <p><b>Canada:</b> After some decline in the late 1970s and early 1980s, incidence has increased again in Canada in recent years.</p> <p><b>Nunavut:</b> Prior to 2008 the rate in Nunavut was consistently lower than the national average. After 2008 the Nunavut rate has been inconsistent but has generally trended up, with a rate of 12 per 100,000 in 2011. A syphilis outbreak was declared in 2012.</p>                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Reservoir</b>                     | Humans.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Transmission</b>                  | <ul style="list-style-type: none"> <li>The primary mode of transmission is vaginal, anal, and oral sexual contact (direct contact with infectious exudates from obvious or concealed moist, early lesions of skin, and with mucous membranes of infected people during sexual contact).</li> <li>Kissing, sharing of needles and injection equipment may result in transmission.</li> <li>Blood transfusion, accidental inoculation (e.g. needle stick injury) and solid organ transplantation have rarely been reported as routes of transmission; note that all blood and organs used for donation in Canada are tested for syphilis.</li> <li>The majority of infants with congenital syphilis are infected in utero, but they can also rarely be infected by contact with an active genital lesion during delivery. Breastfeeding does not result in syphilis transmission to the child unless an infectious lesion is present on the breast.</li> </ul> |
| <b>Incubation Period</b>             | Dependent upon stage; see Table 1 in Clinical Management (Staging) section.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Communicability</b>               | Communicability exists when moist mucocutaneous lesions of primary and secondary syphilis are present.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Susceptibility and Resistance</b> | Universal susceptibility to initial infection and re-infection; approximately 30% of exposures result in infection. Concurrent HIV infection may alter the presentation and response to treatment of syphilis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Screening/Who to Test</b>         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Physical Examination</b> | <p>Detailed examination techniques are provided in the <b>Alberta Blue Book Standards for the Management and Standards of STI Clinic Clients</b>.</p> <p>The following provides some key points involving physical examination in adolescents/adults:</p> <ul style="list-style-type: none"> <li>• Verbal consent must be obtained for the physical examination.</li> <li>• Privacy is essential.</li> <li>• Provide chaperone or assistant when requested by client.</li> <li>• Clinician should at all times maintain a non-judgmental position.</li> <li>• Explain all procedures and tests to the client; recognize the client has the right to refuse.</li> <li>• Mouth and pharyngeal examination if history warrants, e.g. client report of oral lesions.</li> <li>• Inspection of the skin and pubic hair.</li> <li>• Palpation for lymphadenopathy.</li> <li>• Examination of external genitalia; speculum examination is not routinely indicated in females.</li> <li>• Perianal inspection if history warrants, e.g. anal sex.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Laboratory Tests</b>     | <p>Both <b>direct tests</b> and <b>serologic tests</b> are available for the diagnosis of syphilis. <b>Serologic testing</b> is the current standard for syphilis diagnosis; <b>direct tests</b> may be collected from lesions of syphilis (if present). Cerebrospinal fluid (CSF) tests are only performed if indicated (see below)</p> <p><b>Serology</b></p> <p>The interpretation of <b>serologic tests</b> is difficult and should be made in conjunction with a colleague experienced in the management of syphilis (see Table 2 in the Syphilis Chapter of the Canadian Guidelines on Sexually Transmitted Infections, available online at <a href="https://www.canada.ca/en/public-health/services/infectious-diseases/sexual-health-sexually-transmitted-infections/canadian-guidelines/sexually-transmitted-infections/canadian-guidelines-sexually-transmitted-infections-27.html#table-2">https://www.canada.ca/en/public-health/services/infectious-diseases/sexual-health-sexually-transmitted-infections/canadian-guidelines/sexually-transmitted-infections/canadian-guidelines-sexually-transmitted-infections-27.html#table-2</a>).</p> <p>In Nunavut, serologic testing uses a reverse sequence algorithm (see Figure 1 below), which includes three serologic tests:</p> <ol style="list-style-type: none"> <li>1. <b>Syphilis enzyme immunoassay (EIA)</b>. The EIA is an initial screening test. If the EIA is positive, the following 2 tests will be completed by the lab (with</li> </ol> |

the original sample).

2. **Rapid Plasma Reagin (RPR).** The RPR is a measure of disease activity, and is used to follow the response to treatment and to assess for re-infection.
3. ***Treponema pallidum* particle agglutination (TPPA).** The TPPA is used for confirmatory testing. If positive, it is not repeated in individuals over the age of 2 years.

**Figure 1: Sequence of Syphilis Serology Testing**

Several conditions can result in false positive reactions of one or more syphilis tests, including pregnancy, persons from endemic countries infected with other treponemes such as yaws, pinta and bejel, etc.

**Notes:**

- Syphilis testing is available in Nunavut through the regional laboratory route.
- The laboratory requisition or Meditech entry should be completed with the patient name, date of birth and HCP number. Syphilis testing should be indicated on the requisition.
- Use the gold-topped tube for blood (serum) collection. The specimen should be refrigerated and transported to the laboratory in accordance with standard practice guidelines.

**DURATION OF SEROLOGIC RESPONSE**

- In individuals over the age of 2 years, the EIA and TPPA typically remain positive for life, while the RPR typically declines to a low level and may revert to non-reactive. Sero-fast refers to a <4-fold (2 dilution) decline in RPR titers at 6–12 months or as persistently low titers after treatment.
- Infants under the age of 2 years usually have passively transferred maternal antibodies. The non treponemal tests (e.g. RPR) usually sero-revert by 6 months of age and the treponemal tests (syphilis EIA, TPPA) by 15- 18 months of age.

|                | <p><b>Direct test (Swab) for polymerase chain reaction (PCR)</b></p> <ul style="list-style-type: none"><li>• If the patient has lesions suspicious for primary (chancre) or secondary (condyloma lata), swab lesion and place swab in Universal Transport Media (UTM) and indicate “suspect syphilis” on the laboratory requisition. Note that if a specimen is being collected for herpes simplex virus, a second sample will need to be collected.</li><li>• The specimen for syphilis PCR will be submitted to the National Microbiology Laboratory. This anticipated turnaround time for this test result is several weeks. Patient treatment and follow up should not be delayed while awaiting the results. The result will ultimately be used to accurately stage the case as well as for surveillance purposes.</li><li>• <b>A serology specimen must also be collected</b></li></ul> <p><b>Tests from cerebrospinal fluid</b></p> <ul style="list-style-type: none"><li>• In patients with suspected/confirmed syphilis, a lumbar puncture for collection of cerebrospinal fluid (CSF) is recommended. Criteria for CSF examination include:<ul style="list-style-type: none"><li>○ Presence of neurologic, ophthalmic or otic (ear) symptoms</li><li>○ Congenital syphilis</li><li>○ Previously treated patients who fail to achieve an adequate serologic response to treatment</li><li>○ Tertiary syphilis</li></ul></li><li>• CSF should be tested for cell count and differential, protein, VDRL and/or FTA-ABS.</li><li>• CSF VDRL is highly specific and confirms a diagnosis of neurosyphilis. However, it is not very sensitive and may be negative in cases of neurosyphilis.</li><li>• CSF FTA-ABS is very sensitive but non-specific for the diagnosis of neurosyphilis; a negative CSF FTA-ABS helps to exclude a diagnosis of neurosyphilis.</li><li>• The diagnosis of neurosyphilis is usually made on a combination of reactive syphilis serologic tests, abnormalities of CSF cell count or protein or a reactive CSF VDRL with or without clinical manifestations.</li></ul> |                                   |                   |                         |          |                        |                                   |

**PRACTICE NOTE:**

- **\*Recommended treatment is with benzathine penicillin G- long acting (Bicillin® L-A)**
- **Each vial of Bicillin® L-A is 1.2 mu**
- **The dose of 2.4 mu must be split into 2 separate syringes, with 2 injections into separate gluteal muscle sites.**
- **Note that short-acting benzylpenicillin (penicillin G Sodium) (IM or IV), is NOT adequate for treating syphilis.**

‡Doxycycline is not recommended during pregnancy. Therefore, there is no satisfactory alternative to penicillin in pregnancy. Penicillin allergic pregnant women should be considered for desensitization followed by treatment with benzathine penicillin.

(fall in the RPR titre) varies. Table 4 is provided as a guide but some individuals may decline slower or faster than described in the Table. Consult with RCDC for all RPR titres  $\geq 1:32$  dilutions at the end of the follow up period.

**Table 4: Adequate Serologic Response (decline in quantitative RPR titre)**

|              |                                                       |
|--------------|-------------------------------------------------------|
| Primary      | 4-fold* drop at 6 months, 8-fold drop at 12 months    |
| Secondary    | 8-fold drop at 6 months and 16-fold drop at 12 months |
| Early latent | 4-fold drop at 12 months                              |

\*4-fold drop is equivalent to a 2-tube drop (e.g. change from 1:32 dilutions to 1:8 dilutions).

### **HIV TESTING**

- Syphilis increases the risk of acquisition and transmission of syphilis.
- All patients with a new diagnosis of syphilis should have baseline HIV testing.
- Patients with infectious syphilis (primary, secondary, early latent) should have HIV testing repeated at 1 and 3 months after diagnosis.

### **CHILDREN < 2 YEARS OF AGE**

- All three syphilis tests (syphilis EIA, RPR and TPPA) should be performed in children under the age of 2 years. If the infant was being tested in another province/territory, the tests should be repeated after return to Nunavut to provide a new baseline for follow up.
- Infants born to mothers with positive syphilis serology will have passively transferred antibodies until the age of 15-18 months, therefore minimum serologic follow up is at birth, 6 months and 15-18 months of age.
- Non-treponemal tests (e.g. RPR) will typically sero-revert (become non-reactive) by 6 months of age and the treponemal tests (syphilis EIA, TPPA) by 15- 18 months of age.
- Persistently positive tests beyond 18 months of age are indicative of congenital syphilis and require a referral to a pediatrician if one is not already involved.

#### ***Infants born to mothers with positive syphilis serology who are adequately treated prior to pregnancy:***

- Clinical or serologic follow up of infant is not required unless it is suspected that the mother may have acquired syphilis during the current pregnancy.
- If serologic follow up is desired to ensure clearance of passively transferred antibodies, serology (syphilis EIA, RPR and TPPA) should be collected from the infant at birth, repeated at 6 months of age and if any serologic test remains positive at that time, repeated at 15-18 months of age.

#### ***Infants born to mothers diagnosed and treated for late latent syphilis during pregnancy:***

- Serology (syphilis EIA, RPR, TPPA) should be collected from the infant at birth, repeated at 6 months of age and if any serologic test remains positive at that

Confirm surveillance staging and follow up plan for all suspect and confirmed cases with TSC/TCDC within 1 month of receipt of forms.</li></ol> |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

\* A suspect case does not yet meet the case definition for syphilis (e.g. a patient presenting with symptoms of syphilis, awaiting serologic confirmation of syphilis, and has not been named as a contact of a known case).

**CONTACTS:**

Contact notification is to be done by health care providers in conjunction with public health.

**Table 8: Contact Management for Health Care Providers**

1. Notify the *Contact* in the most appropriate manner (phone, text message, or home visit with appointment card and Contact Notification Letter 1 (section 6.4.7) to come to the clinic as soon as possible (within 1-2 business days).
2. Re-contact until *Contact* attends the clinic (daily attempts for 3 consecutive business days).
3. If *Contact* does not come in to the clinic, repeat the following week (daily attempts for 3 consecutive business days), in most appropriate manner (phone, text message, or home visit with appointment card and Contact Notification Letter 2 (section 6.4.8).
4. If *Contact* has not come in to clinic, mail the Contact Notification Letter 3 (section 6.4.9).
5. Discuss *Contact* management at the next case conference with RCDC.
6. When *Contact* attends clinic, ***Contact* should be tested and treated for syphilis in the same visit without awaiting laboratory results\***.
7. For contact who has been tested and treated: if laboratory results are negative, no post-treatment serologic follow-up is needed. If laboratory results are positive, follow the same serologic follow-up and partner notification procedures as for cases.
8. For contact who was tested but refused treatment and the test is negative, retest in 2-4 weeks.

**Table 9: Contact Management for Regional Communicable Disease Coordinators (RCDCs)**

1. Follow up weekly with the appropriate health care provider(s) treating the *Contacts*, until the following criteria for closure of a *Contact* investigation file is fulfilled:
  - a. Seen by a health care provider, serology completed and treatment given (if needed) OR
  - b. Lost to follow up due to any of the following:
    - Inadequate information to identify or locate the *Contact*.
    - The *Contact* has moved out of Nunavut and no forwarding contact information is available. If forwarding contact information is available, the RCDC must advise the Territorial Communicable Disease Consultant (TCDC), who will communicate with the other jurisdiction.
    - The *Contact* does not come in to the clinic and the RCDC has discussed this *Contact* at the next case conference with the Office of the Chief Medical Officer of Health.
2. For *Contacts* who are subsequently diagnosed with Syphilis, send completed *Syphilis Report Form* and *STI Contact Investigation Forms* to TCDC (within one of week of diagnosis). These Forms do not need to be submitted for *Contacts* who test negative for Syphilis.

| Staging for Surveillance Purposes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Appendix 1: Screening Questions for Neurosyphilis (including Ocular and Otosyphilis)**  
(Adapted from HIV/STD Program, Public Health Seattle and King County, January 21, 2015. Available at: <https://www.kingcounty.gov/depts/health/communicable-diseases/hiv-std/~media/depts/health/communicable-diseases/documents/hivstd/Screening-Tool-Neurosyphilis.ashx>)

**Screening questions:**

1. *Symptoms of Otosyphilis (ear)*
  - a. Have you recently had new trouble hearing?
  - b. Do you have ringing in your ears?
2. *Symptoms of Ocular syphilis (eye)*
  - a. Have you recently had a change in vision?
  - b. Do you see flashing lights?
  - c. Do you see spots that move or float by in your vision?
  - d. Have you had any blurring of your vision?
3. *Symptoms of neurosyphilis*
  - a. Are you having new headaches?
  - b. Have you recently been confused?
  - c. Has your memory recently gotten worse?
  - d. Do you have trouble concentrating?
  - e. Do you feel that your personality has recently changed?
  - f. Are you having a new problem walking?
  - g. Do you have weakness or numbness in your legs?

**If the patient has symptoms suggestive of eye, ear or other neurologic involvement and no alternative explanation is available, consult with RCDC regarding next steps. RCDC will consult with TCDC/TSC as needed. In addition, referral for ENT or Ophthalmology assessment may be needed.**

## SYPHILIS REPORT FORM (≥2 Years\*)

\*For children < 2 years use **Syphilis Report Form for Infants**

For use by front line health care providers; please fax or scan to RCDC

Date of Assessment (DDMMYY): \_\_\_\_\_ - \_\_\_\_\_ - \_\_\_\_\_

Case ID: (assign after lab-confirmation) \_\_\_\_\_

### REPORTING CLINICIAN

|            |              |
|------------|--------------|
| Name:      | Position:    |
| Signature: | Report Date: |

Please fill in OR addressograph/affix label:

Last Name: \_\_\_\_\_

First Name: \_\_\_\_\_

Sex (M/F): \_\_\_\_\_

DOB (dd/mm/yyyy): \_\_\_\_\_

Chart #: \_\_\_\_\_

HCP #: \_\_\_\_\_

Community of Residence: \_\_\_\_\_

### BOX 1.1 - DEMOGRAPHIC INFORMATION

**Ethnicity** (check one box only, unless specified)

Canadian born:

☐ Inuit

☐ Other Indigenous (specify) \_\_\_\_\_

☐ Caucasian

☐ Black

☐ Other (specify) \_\_\_\_\_

☐ Foreign-born

(specify country):

|  |
|--|
|  |
|--|

Reporting community: \_\_\_\_\_

If visiting Nunavut, place of residency: \_\_\_\_\_

### BOX 1.2 - REASON FOR TESTING

check one box only:

☐ Known contact of a case

☐ Symptomatic of syphilis

☐ Prenatal screen

☐ STI screen

☐ Sexual assault/abuse

☐ Follow up serology

☐ Other routine screen (including pap smear)

☐ Other (specify) \_\_\_\_\_

### BOX 1.3 - SYPHILIS HISTORY

Date of most recent possible exposure: \_\_\_\_ - \_\_\_\_ - \_\_\_\_

Pregnant: ☐ Yes (due date: \_\_\_\_ - \_\_\_\_ - \_\_\_\_ -) ☐ No ☐ Unknown

Previous Syphilis diagnosis?

☐ No (date of last negative serology: \_\_\_\_ - \_\_\_\_ - \_\_\_\_ -) ☐ Yes ☐ Unknown

If Yes, Year(s) of previous diagnosis: \_\_\_\_\_

Stage of previous diagnosis: \_\_\_\_\_

Date of last serology: \_\_\_\_ - \_\_\_\_ - \_\_\_\_

RPR result: \_\_\_\_\_

### BOX 1.4 - TRAVEL

In the 12 months prior to diagnosis, please list:

Nunavut communities case has travelled to/lived in:

Out of territory travel/residence (specify locations):

### BOX 1.5 - SIGNS AND SYMPTOMS

Physical exam done: ☐ Yes ☐ No If No, why?

Symptoms: Onset Date (dd/mm/yyyy)

☐ Chancre (specify location):

Date:

☐ General lymphadenopathy

Date:

☐ Condyloma lata

Date:

☐ Rash (specify location):

Date:

☐ Fever

Date:

☐ Neurological\*\*

Date:

☐ Other (specify):

Date:

☐ Asymptomatic

Date:

### BOX 1.6 - RISK FACTORS

Risk factors in the 12 months prior to diagnosis

Exchange of sex for money/drugs

☐ Yes ☐ No

Been in jail/juvenile detention

☐ Yes ☐ No

Men who have sex with men

☐ Yes ☐ No

Sex without a condom

☐ Yes ☐ No

Multiple sex partners

☐ Yes ☐ No

History of other STI

☐ Yes ☐ No

Under-housed/unstable housing

☐ Yes ☐ No

Felt unsafe in housing situation

☐ Yes ☐ No

Use of alcohol

☐ Yes ☐ No

Use of drugs

☐ Yes ☐ No

Specify drugs used/how used:

\*\*see Screening questions for neurosyphilis (Appendix 1. Syphilis Protocol)

Case name: \_\_\_\_\_

### BOX 1.7 – INITIAL TESTING

| Date Blood Drawn               | Test                                  | Result: check one box, update as necessary         |                                   |                                  |                                        |
|--------------------------------|---------------------------------------|----------------------------------------------------|-----------------------------------|----------------------------------|----------------------------------------|
| ____/____/____<br>(dd/mm/yyyy) | Syphilis EIA                          | <input type="checkbox"/> Positive                  | <input type="checkbox"/> Negative | <input type="checkbox"/> Pending | <input type="checkbox"/> Indeterminate |
|                                | RPR                                   | <input type="checkbox"/> Positive <b>RPR dils:</b> | <input type="checkbox"/> Negative | <input type="checkbox"/> Pending | <input type="checkbox"/> Indeterminate |
|                                | TPPA                                  | <input type="checkbox"/> Positive                  | <input type="checkbox"/> Negative | <input type="checkbox"/> Pending | <input type="checkbox"/> Indeterminate |
|                                | HIV (Required to determine treatment) | <input type="checkbox"/> Positive                  | <input type="checkbox"/> Negative | <input type="checkbox"/> Pending | <input type="checkbox"/> Indeterminate |

### BOX 1.8 – TREATMENT Refer to *Syphilis Public Health Protocol* of the Nunavut Communicable Disease Manual (February 2013 or later)

| Clinical case staging (check one)      | Type of treatment given*                                                                                                          | Date(s) Given |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|---------------|
| <input type="checkbox"/> Primary       | <input type="checkbox"/> Long-acting Benzathine penicillin G (Biclin-LA) <b>single dose</b><br>(primary, secondary, early latent) | 1.            |
| <input type="checkbox"/> Secondary     | <input type="checkbox"/> Long-acting Benzathine penicillin G (Biclin-LA) <b>weekly X2</b> (pregnant)                              | 2.            |
| <input type="checkbox"/> Early latent  | <input type="checkbox"/> Long-acting Benzathine penicillin G (Biclin-LA) <b>weekly X3</b> (late latent)                           | 3.            |
| <input type="checkbox"/> Late latent   | Please note: pre-filled syringe contains 1.2 MU; <b>you will need 2 syringes per 1 dose</b>                                       |               |
| <input type="checkbox"/> Neurosyphilis |                                                                                                                                   |               |
| <input type="checkbox"/> Unknown       | <b>For penicillin allergies only***:</b>                                                                                          |               |
| <input type="checkbox"/> Other         | <input type="checkbox"/> Doxycycline**** 100 mg po BID for <b>14 days</b>                                                         | Date started: |
|                                        | <input type="checkbox"/> Doxycycline 100 mg po BID for <b>28 days (late latent)</b>                                               | Date started: |

\*For **all pregnant, HIV+, tertiary, neuro or congenital patients**, must consult with a specialist (Infectious Disease, Pediatrician, and/or Obstetrician) prior to treatment

\*\* MU = million units

\*\*\* Refer to Alternative Treatment for Penicillin-allergic Patients in the *Nunavut Communicable Disease Manual* (February 2013 or later)

\*\*\*\*NOT to be given in pregnancy.

### BOX 1.9 – PUBLIC HEALTH FOLLOW UP

|                                                                                       |                                                |
|---------------------------------------------------------------------------------------|------------------------------------------------|
| Syphilis staging verified by:                                                         |                                                |
| <input type="checkbox"/> Territorial Syphilis Specialist (name): _____                |                                                |

# Syphilis Decisional Support Tool

**Syphilis:** A sexually transmitted infection caused by *Treponema pallidum* (*T. pallidum*), a bacterium.

- Syphilis is classified into stages that reflect the degree of infectivity and progression of the disease (see Table 1 below). Stages marked with a \* are infectious (including neurosyphilis < 1 year after infection).
- The diagnosis of syphilis is made with a combination of symptoms, signs, past history of syphilis and/or treatment for syphilis as well as the results of direct and serologic tests.

### Table 1- Syphilis Stages

| Stage                          | Incubation period                   | Clinical manifestations                                                                                                                             |
|--------------------------------|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Primary*</b>                | 3 weeks (3 to 90 days)              | Chancre, regional lymphadenopathy                                                                                                                   |
| <b>Secondary*</b>              | 2 to 12 weeks (2 weeks to 6 months) | Rash, fever, malaise, lymphadenopathy, mucus lesions, condyloma lata, patchy or diffuse alopecia, meningitis, headaches, uveitis, retinitis, iritis |
| <b>Latent</b>                  | Early*: < 1 year<br>Late: ≥ 1 year  | Asymptomatic                                                                                                                                        |
| <b>Tertiary</b>                |                                     |                                                                                                                                                     |
| <b>Cardiovascular syphilis</b> | 10 to 30 years                      | Aortic aneurysm, aortic regurgitation, coronary artery ostial stenosis                                                                              |
| <b>Neurosyphilis*</b>          | <2 years to 20 years                | Ranges from asymptomatic to symptomatic with headaches, vertigo, personality changes, dementia, ataxia, presence of Argyll Robertson pupil          |
| <b>Gumma</b>                   | 1 - 46 years (most cases 15 years)  | Tissue destruction of any organ; manifestations depend on site involved                                                                             |
| <b>Congenital</b>              |                                     |                                                                                                                                                     |
| <b>Early</b>                   | Onset <2 years                      | 2/3 may be asymptomatic; fulminant disseminated infection, mucocutaneous lesions, osteochondritis, anemia, hepatosplenomegaly, neurosyphilis        |
| <b>Late</b>                    | Persistence >2 years after birth    | Interstitial keratitis, lymphadenopathy, hepatosplenomegaly, bone involvement, anemia, Hutchinson's teeth, neurosyphilis                            |

\*infectious (including neurosyphilis < 1 year after infection)

## 2 Serology Interpretation/Diagnosis

**\* For ALL prenatal cases review Syphilis Decision Support Tool for Pregnancy**

## ① Screening Tests

**SEROLOGY:**

Serologic testing is the current standard for syphilis diagnosis. There are 3 serological tests:

1. **Syphilis enzyme immunoassay (EIA).** The EIA is an initial screening test. If the EIA is positive, the following 2 tests will be completed by the lab (with the original sample).
2. **Rapid Plasma Reagin (RPR).** The RPR is a measure of disease activity, and is used to follow the response to treatment and to assess for re-infection.
3. ***Treponema pallidum* particle agglutination (TPPA).** The TPPA is used for confirmatory testing. If positive, it is not repeated in individuals over the age of 2 years.

### **DIRECT TEST FOR POLYMERASE CHAIN REACTION (PCR):**

If the patient has lesions suspicious for primary (chancres) or secondary (condyloma lata), swab lesion and place swab in Universal Transport Media (UTM) and indicate "suspect syphilis" on the laboratory requisition. Note that if a specimen is being collected for herpes simplex virus, a second sample will need to be collected.

## CONTACT TRACING

**It is important to ensure all people who have had sexual contact with a case are adequately screened and treated.**

**Step 1:** Complete the *STI Contact Investigation Form* dated August 2018 or later (section 6.4.3).

**Step 2:** The traceback period for sexual partner follow-up is determined by the stage of syphilis. All sexual and perinatal contacts within the time periods below must be identified and located.

| Syphilis stage       | Trace-back period |
|----------------------|-------------------|
| Primary              | 3 months          |
| Secondary            | 6 months          |
| Early latent         | 1 year            |
| Late latent/Tertiary | Consult RCDC      |
| Congenital           | Consult RCDC      |
| Stage Undetermined   | Consult RCDC      |

**NOTE:** Contacts should be tested and treated in the same visit without awaiting laboratory results.

# Syphilis Decisional Support Tool

### ③ Treatment and Serology Follow-up Period: Primary, secondary, and early latent cases

**TREATMENT:**

- **Long-acting Benzathine penicillin G (Bicillin-LA)\***
- **Dose: 2.4 MU comprised of 2 separate injections of 1.2 MU each.**
- **Route: Deep intramuscular injection in ventral or dorsal gluteal muscles (NOT deltoid)**
- **1 treatment only**

**\*For penicillin allergic patients: refer to treatment section of Syphilis Protocol in Nunavut Communicable Disease Manual (6.4.1)**

### Serology Follow-up:

- RPR serology should be completed 1, 3, 6 and 12 months after treatment unless RPR is non-reactive.
- Consult RCDC for all RPR titres  $\geq 1:32$  dilutions at the end of the follow up period; CSF examination may be required.
- HIV serology should be done at baseline and 1 and 3 months.

**Adequate Serologic Response\* (decline in quantitative RPR titre)**

|              |                                                     |
|--------------|-----------------------------------------------------|
| Primary      | 4-fold** drop at 6 months, 8-fold drop at 12 months |
| Secondary    | 8-fold drop at 6 months, 16-fold drop at 12 months  |
| Early Latent | 4-fold drop at 12 months                            |

**\*This is a general guide. Some individuals may decline slower or faster**

**\*\*4-fold drop is equivalent to a 2-tube drop (e.g. change from 1:32 dilutions to 1:8 dilutions).**

#### ④ Treatment and Serology Follow-up Period: Late latent and cardiovascular cases

**TREATMENT:**

- Long-acting Benzathine penicillin G (Bicillin-LA)\*
- Dose: 2.4 MU comprised of 2 separate injections of 1.2 MU each.
- Route: Deep intramuscular injection in ventral or dorsal gluteal muscles (NOT deltoid)
- Repeat dose weekly for 3 consecutive weeks

**\*For penicillin allergic patients: refer to treatment section of Syphilis Protocol in Nunavut Communicable Disease Manual (6.4.1)**

**Serology Follow-up:**

- RPR serology should be completed 12 and 24 months after treatment unless RPR is non-reactive. Consult RCDC for all RPR titres  $\geq 1:32$  dilutions at the end of the follow up period.
- HIV serology, urine for gonorrhea and chlamydia should be done at baseline.
- Ensure Syphilis Assessment Report Form has been completed and faxed to RCDC.

# Syphilis Decisional Support Tool for Pregnancy and Infancy

**Syphilis:** A sexually transmitted infection caused by *Treponema pallidum* (*T. pallidum*), a bacterium of the order spirochaeta.

- Syphilis is classified into stages that reflect the degree of infectivity and progression of the disease (see Table 1 below). Stages marked with a \* are infectious (including neurosyphilis < 1 year after infection).
- Diagnosis and treatment of Syphilis in pregnancy requires special considerations. Additionally, there are considerations for the infant in the postpartum period.

### Table 1- Syphilis Stages

| Stage                          | Incubation period                   | Clinical manifestations                                                                                                                      |
|--------------------------------|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Primary*</b>                | 3 weeks (3 to 90 days)              | Chancre, regional lymphadenopathy                                                                                                            |
| <b>Secondary*</b>              | 2 to 12 weeks (2 weeks to 6 months) | Rash, fever, malaise, lymphadenopathy, mucus lesions, condyloma lata, patchy or diffuse alopecia, meningitis, headaches, uveitis, retinitis  |
| <b>Latent</b>                  | Early*: < 1 year<br>Late: ≥ 1 year  | Asymptomatic                                                                                                                                 |
| <b>Tertiary</b>                |                                     |                                                                                                                                              |
| <b>Cardiovascular syphilis</b> | 10 to 30 years                      | Aortic aneurysm, aortic regurgitation, coronary artery ostial stenosis                                                                       |
| <b>Neurosyphilis*</b>          | <2 years to 20 years                | Ranges from asymptomatic to symptomatic with headaches, vertigo, personality changes, dementia, ataxia, presence of Argyll Robertson pupil   |
| <b>Gumma</b>                   | 1 - 46 years (most cases 15 years)  | Tissue destruction of any organ; manifestations depend on site involved                                                                      |
| <b>Congenital</b>              |                                     |                                                                                                                                              |
| <b>Early</b>                   | Onset <2 years                      | 2/3 may be asymptomatic; fulminant disseminated infection, mucocutaneous lesions, osteochondritis, anemia, hepatosplenomegaly, neurosyphilis |
| <b>Late</b>                    | Persistence >2 years after birth    | Interstitial keratitis, lymphadenopathy, hepatosplenomegaly, bone involvement, anemia, Hutchinson's teeth, neurosyphilis                     |

\*infectious (including neurosyphilis < 1 year after infection)

## ① Screening Tests

**SEROLOGY:**

Serologic testing is the current standard for syphilis diagnosis. There are 3 serological tests:

1. **Syphilis enzyme immunoassay (EIA).** The EIA is an initial screening test. If the EIA is positive, the following 2 tests will be completed by the lab (with the original sample).
2. **Rapid Plasma Reagin (RPR).** The RPR is a measure of disease activity, and is used to follow the response to treatment and to assess for re-infection.
3. ***Treponema pallidum* particle agglutination (TPPA).** The TPPA is used for confirmatory testing. If positive, it is not repeated in individuals over the age of 2 years.

### SEROLOGICAL TESTING IN PREGNANCY:

All pregnant women **MUST** be screened in the first trimester (initial pregnancy screening), at 24-28 weeks, and near term (35-37 weeks) or at delivery. If the pregnant woman and/or her partner are at risk of becoming infected or re-infected during pregnancy, RPR may be repeated as often as monthly and at delivery. HIV, gonorrhea and chlamydia screens should also be done.

## 2 Case Follow-up of Pregnant Women with Positive Serology

### ③ Case Follow-up of Infants Born to Pregnant Women with Positive Syphilis Serology

**NOTE: If congenital syphilis is suspected based on mother's serologies or concerning symptoms, consult with a pediatric infectious disease specialist regarding further work up which may include long bone x-rays, lumbar puncture and other investigations.**

Dear: \_\_\_\_\_

The \_\_\_\_\_ Health Centre is giving you this letter because it is likely that you have been exposed to an infectious disease.

This infection can be treated. Even though you may not have symptoms, it can have serious effects on your health if left untreated.

It is important for you to have a health check-up as soon as possible.

Please call \_\_\_\_\_ to make an appointment.

RN/CHN \_\_\_\_\_

Appointment Date and Time \_\_\_\_\_

Date: \_\_\_\_\_

Dear: \_\_\_\_\_

The \_\_\_\_\_ Health Center/Iqaluit Public Health has been trying to reach you. You have been named as a contact of someone who has an infectious disease or your test result shows that you have an infection.

Please come to the health center to make sure you are properly tested and treated for this disease.

Although you may not feel sick at this time, if these infections go untreated they can cause anyone with whom you are in close contact to become ill and/or you may become more seriously ill in the future.

Please call \_\_\_\_\_ to make an appointment as soon as possible.

RN/CHN

# Fact Sheet

## Syphilis

### What is syphilis?

Syphilis is a sexually transmitted infection (STI) caused by the bacteria *Treponema pallidum*.

### How do you get syphilis?

The more sexual partners you have, the more likely you are to be exposed to a STI. You can get syphilis, like any other STI, through unprotected vaginal, anal or oral sex. It can also be passed from an infected mother to her baby while it is in the womb.

### What are the symptoms of syphilis?

Early syphilis has symptoms, as the infection progresses symptoms disappear – this does not mean the infection is gone! Even if symptoms go away you can still spread infection and should be tested and treated. It can also damage your baby while you are pregnant. When the syphilis bacteria enters the body, the infection goes through stages:

- The **primary stage** occurs when the bacteria enters the body. A painless sore (chancre) usually appears within 3 to 90 days after sexual contact with an infected person. Many people do not notice the sore because it is painless and can heal without treatment, but this does not mean the infection is gone. Without treatment the infection continues to the next stage.
- The **secondary stage** usually occurs 2 weeks to 6 months after the chancre. A rash may develop anywhere on the body, but most often on the palms of the hands and the soles of the feet. There are also other symptoms.
- **Latent stage** follows the secondary stage and can last for over 20 years - the rash disappears without treatment and there are no more symptoms, however the bacteria is still spreading in the body.
- **Tertiary stage** follows the latent period - the bacteria that spread cause damage to the body including the heart, brain and other organs leading to death.

### How do you know you have syphilis?

A blood test is used to diagnose syphilis. If you think you have been infected, tell the doctor/nurse, and ask for a blood test.

### What is the treatment for syphilis?

Most cases of syphilis can be treated with 2 injections of penicillin given at the same time. Some people will need more doses of the 2 injections given one week apart. After the treatment, follow-up blood tests are done to make sure the treatment worked.

It is important that the individual who is being treated and any of their sex partners not have sex for 7 days after both of them have finished the treatment.

### What other tests should be done?

You should get tested for other STIs including: chlamydia, gonorrhea and HIV. If you have an untreated STI like syphilis, it is easier for you to get HIV. It is also possible to have more than one infection at a time, so it is important to get tested for other STIs.

### What about sexual partners?

All sexual partners need to be tested and treated if they are infected.

- Primary stage, tell partners within the past 3 months.
- Secondary stage, tell partners within the past 6 months.
- Latent and tertiary stage, tell partners within the past year and long-term partners. Children may also need to be tested.

## Syphilis

### Qu'est-ce que la syphilis?

La syphilis est une infection transmissible sexuellement (ITS) causée par la bactérie *Treponema pallidum*.

### Comment la syphilis se transmet-elle?

Les personnes qui ont plus d'un partenaire sexuel accroissent leur risque de contracter une ITS. La syphilis se transmet lors de relations sexuelles vaginales, anales ou orales non protégées. Les femmes enceintes qui ont une ITS peuvent également la transmettre à leur fœtus et il est possible que la santé du bébé soit affectée.

### Quels sont les symptômes de la syphilis?

Des symptômes apparaissent en période de syphilis précoce (voir le premier stade ci-dessous), toutefois, à mesure que l'infection progresse les symptômes peuvent disparaître. Cela ne veut pas dire que l'infection a disparu! Même si les symptômes disparaissent, vous devez subir un test de dépistage et recevoir un traitement médical si le test s'avère positif. Les personnes infectées peuvent transmettre l'infection même si elles ne présentent aucun symptôme.

Une description des divers stades de la syphilis et de son évolution figure ci-dessous :

- Le premier stade, la syphilis primaire, débute lorsque la bactérie pénètre dans l'organisme. Une ulcération indolore appelée chancre apparaît généralement de 3 à 90 jours après un contact sexuel avec une personne infectée. Puisqu'elle est indolore, de nombreuses personnes ne remarqueront pas la présence de l'ulcération, qui peut disparaître sans traitement, ce qui ne signifie pas que l'infection soit disparue. En l'absence de traitement, l'infection évoluera vers le deuxième stade.
- Le deuxième stade, soit la syphilis secondaire, s'amorce de deux semaines à six mois après l'apparition du chancre. Une éruption cutanée peut se produire sur n'importe quelle partie du corps, mais apparaît le plus souvent sur la paume des mains et sur la plante des pieds.
- Le stade latent, soit la syphilis latente, peut durer plus de 20 ans; l'éruption cutanée disparaît sans traitement et la personne infectée est asymptomatique. Sans traitement adéquat, la bactérie continue de se propager dans l'organisme.
- Le stade tertiaire, la bactérie envahit les organes internes du corps et peut causer d'importantes lésions au cœur, au cerveau et à d'autres organes, et même la mort dans certains cas.

### Comment diagnostique-t-on la syphilis?

Une analyse de sang permet de diagnostiquer la syphilis. Si vous croyez avoir été infecté, présentez-vous à votre centre de santé communautaire et parlez à un médecin ou à une infirmière et demandez qu'une analyse de sang soit effectuée.

### Quel est le traitement contre la syphilis?

La plupart des cas de syphilis peuvent être traités avec deux injections simultanées de pénicilline. Parfois, les deux injections peuvent être administrées à une semaine d'intervalle si une ou deux doses supplémentaires sont nécessaires. Des comprimés peuvent être administrés aux personnes ne pouvant recevoir de pénicilline. Il est important que la personne traitée ainsi que son ou ses partenaires sexuels n'aient pas de relations dans les sept jours suivant la fin de leur traitement respectif.

# Feuille de renseignements

## Syphilis

### Y a-t-il d'autres tests à subir?

On suggère de passer un test de dépistage d'autres ITS, notamment la chlamydia, la gonorrhée et le VIH. Le VIH se transmet plus facilement aux personnes présentant une ITS non traitée telle que la syphilis. Puisqu'il est possible d'être atteint de plus d'une infection en même temps, il est important d'effectuer des tests de dépistage pour d'autres ITS.

### Qu'en est-il des partenaires sexuels?

Tous vos partenaires sexuels doivent subir un test de dépistage et être traités s'ils sont infectés.

- Lors du premier stade, avertissez tous vos partenaires des trois derniers mois.
- Lors du deuxième stade, informez tous vos partenaires des six derniers mois.
- Lors des stades latent et tertiaire, informez tous vos partenaires de la dernière année et vos partenaires de longue date. Les enfants issus de ces relations doivent subir un test de dépistage.

Visitez le site (<http://www.irespectmyself.ca>) pour en apprendre davantage sur la santé sexuelle et les relations sexuelles.

## 7.0 Vaccine Preventable Infections

### Purpose

The purpose of this section of the Communicable Disease Manual is to provide guidelines for the investigation and management of individuals who have been diagnosed with notifiable infections spread by vaccine preventable diseases, including Diphtheria, Invasive *Haemophilus influenzae* (types A and B), Measles, Mumps, Pertussis, Poliomyelitis, Rubella, Congenital Rubella, Smallpox, Tetanus and Varicella.

### Legislation/Policy

Authority for the reporting of notifiable infections spread by vaccine preventable diseases and their public health management comes from the *Public Health Act, Communicable Disease Regulations*.

All clients who have been diagnosed with a notifiable infection spread by vaccine preventable diseases must be reported to the Chief Medical Officer of Health (CMOH).

All clients who are suspected to have or have a confirmed notifiable infection spread by vaccine preventable diseases are to be followed as per the protocols in this section.

### Roles and Responsibilities

**Table 7.1: Roles and responsibilities for follow up of vaccine preventable infections**

| Role                                                                                                                                | Responsibilities                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Infectious Agent</b>      | Diphtheria is caused by <i>Corynebacterium diphtheriae</i> , a gram-positive bacillus. Strains may be toxigenic or nontoxigenic. Only the toxigenic strain produces exotoxin and can cause serious disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Clinical Presentation</b> | <p>Diphtheria is an acute bacterial disease that can involve almost any mucous membrane, primarily involving the pharynx, tonsils, larynx or nose and occasionally the skin, conjunctivae or vagina. The characteristic lesion, caused by liberation of a specific cytotoxin, is marked by a patch or patches of an asymmetrical adherent greyish white membrane with surrounding inflammation.</p> <p>Diphtheria can be classified based on site of infection:</p> <ol style="list-style-type: none"> <li>(1) <b>Pharyngeal/tonsillar:</b> This is the most common site of infection and is associated with the absorption of toxin. The onset is insidious. Early symptoms include malaise, sore throat, anorexia and low-grade fever. Two to three days later the membrane appears in the pharyngeal/tonsillar area. The membrane initially appears white and glossy, but evolves into a dirty gray color with patches of green or black necrosis. The extent of the membrane correlates with the severity of symptoms. In cases of severe disease the individual may also develop edema of the submandibular areas and the anterior neck, along with lymphadenopathy, giving the characteristic “bullneck” appearance. The individual may recover or, depending on the amount of toxin absorbed, develop severe illness, pallor, rapid pulse, stupor and coma with death occurring in 6-10 days.</li> <li>(2) <b>Nasal:</b> Symptoms include a mucopurulent nasal discharge, which may become blood tinged and a membrane may form on the nasal septum. Signs indicating toxin effect are rare.</li> <li>(3) <b>Laryngeal:</b> This may be either an extension of the pharyngeal form or be the only site involved. Symptoms include fever, hoarseness and a barking cough. Development of the membrane may lead to airway obstruction, coma, and death.</li> <li>(4) <b>Cutaneous:</b> <i>C. diphtheriae</i> can cause clinical skin infections characterized by a scaling rash or by chronic non-healing ulcers with a dirty gray membrane and are often associated with <i>Staphylococcus aureus</i> and group A streptococci. This type of Diphtheria is often associated with overcrowding, impoverished groups and homeless persons. Cutaneous sites of <i>C. diphtheriae</i> have been shown both to contaminate the inanimate environment and to induce throat infections in others. Bacterial shedding from cutaneous infections continues longer than from the respiratory tract. Because <i>C. diphtheriae</i> is usually isolated in association with other known skin pathogens, and because the ulcers do not respond to antitoxin therapy, there is debate as to whether or not the isolates are actually causing clinical illness.</li> </ol> |
| <b>Diagnostics</b>           | Diagnosis is usually made based on history and clinical presentation as it is essential to begin therapy as soon as possible. Diphtheria should be suspected                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                   | <p>based on the following clinical clues:</p> <ul style="list-style-type: none"> <li>• Mildly painful tonsillitis and/or pharyngitis with associated membrane, especially if the membrane extends to the uvula and soft palate;</li> <li>• Adenopathy and cervical swelling, especially if associated with the membranous pharyngitis and signs of systemic toxicity;</li> <li>• Hoarseness and stridor;</li> <li>• Palatal paralysis;</li> <li>• Serosanguinous nasal discharge with associated mucosal membrane; and</li> <li>• Temperature elevation rarely in excess of 39.4°C (103°F).</li> </ul> <p>The differential diagnosis includes infectious mononucleosis, streptococcal or viral pharyngitis and tonsillitis, Vincent's angina and acute epiglottitis.</p> <p>The role of the laboratory in the diagnosis of Diphtheria is to assist the clinicians in confirming their clinical diagnosis. Diagnosis is confirmed by bacteriologic examination of specimens. Cultures of lesions, if present and the nasopharynx are done to confirm the diagnosis. Swab(s) from the nasopharynx, especially the membrane, is essential.</p> <p>Follow your regional laboratory procedures for testing.</p>                                                                                                                                                                                                                                                                                |
| <b>Treatment</b>  | <p><b>Treatment for Diphtheria should be done in consultation with an Infectious Disease Specialist. The following points are for general guidance only.</b></p> <p>For Pharyngeal or Laryngeal Diphtheria, early administration of diphtheria antitoxin is recommended. A single dose of diphtheria antitoxin is indicated to neutralize the circulating diphtheria toxin and should be given in the early stages if Diphtheria is suspected, without waiting for laboratory confirmation. Dosage is based on the degree of disease involvement.</p> <p>Treat with erythromycin for 14 days. Antibiotics are not a replacement for antitoxin. Supportive treatment, in hospital or at home, is advised under strict isolation until two consecutive throat cultures are negative for diphtheria bacilli. These cultures should be taken not less than 24 hours apart and not less than 24 hours after the completion of the course of antibiotics.</p> <p>For Cutaneous Diphtheria, the skin lesions should be cleaned with soap and water and a course of oral antibiotics should be given for a 10 day period. Antitoxin may be of some use in cutaneous disease, because of toxin sequelae.</p> <p>Eligibility for diphtheria antitoxin will be determined through discussion with the Chief Medical Officer of Health (CMOH)/Deputy CMOH. If Diphtheria is suspected, contact your Regional Communicable Disease Coordinator (RCDC) immediately to discuss diphtheria antitoxin.</p> |
| <b>Pathogen</b>   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Occurrence</b> | <p><b>Worldwide:</b> Diphtheria is typically a disease of colder months in temperate climates. Cutaneous Diphtheria is more common in the tropics where seasonal trends are less distinct. Those affected are most commonly unimmunized children under 15 years of age or groups of adults whose immunization has been neglected. The overall case-fatality rate for Diphtheria has changed very little in the past 50 years and is between 5–10%, with higher rates (up to 20%) among persons younger than 5 or older than 40 years of age. Diphtheria is uncommon in industrialized countries, such as Canada and the United States, where routine immunization has virtually eliminated endemic disease.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                                      | <p><b>Canada:</b> The diphtheria toxoid was licensed for use in Canada in 1926 and was introduced as routine immunization in 1930. This led to a substantial decline in diphtheria morbidity and mortality. Since 1983, there have been fewer than five cases reported per year and no deaths, with only one case per year in 2002–2004. The majority of cases have occurred in adults without adequate immunization.</p> <p><b>Nunavut:</b> There have been no cases of Diphtheria reported in Nunavut.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Reservoir</b>                     | Humans                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Transmission</b>                  | <p>The most common modes of spread are via respiratory droplets or direct contact with either respiratory secretions or exudates from infected skin lesions. Close face to face contact with a case or carrier is usually required in order for transmission to occur. Transmission via fomites, raw milk and milk products is rare. Articles soiled with discharges from infected lesions are also potential sources of transmission.</p> <p>Most respiratory disease occurs in the colder months in temperate climates and is associated with crowded indoor living conditions and hot dry air. Sporadic cases most often result from exposure to carriers who are asymptomatic as these carriers are responsible for perpetuating the spread of disease. Exact carriage rates are unknown but in endemic areas 3–5% of healthy individuals may harbour the organism in their throats.</p> <p>Skin infection, which was thought to be primarily a problem in tropical environments, has caused epidemics in Europe and North America among destitute inner city dwellers and substance abusers. Skin carriage can become a silent reservoir for the organism and it has been shown that person to person transmission from infected skin sites is more efficient than from the respiratory tract.</p> |
| <b>Incubation Period</b>             | The incubation period is typically 2-5 days with a range 1-10 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Communicability</b>               | Transmission may occur as long as virulent bacilli are present in discharges and lesions; 2-4 weeks in untreated individuals. Usually communicability will end within 4 days after the administration of appropriate antibiotics. Occasionally, chronic carriage occurs even after treatment; chronic carriers may shed the organism for 6 months or more.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Susceptibility and Resistance</b> | Routine vaccination is recommended as per the Nunavut publicly funded immunization schedule. Immunization with diphtheria toxoid produces prolonged but not lifelong immunity. Lifelong immunity is generally, but not always, acquired following disease or inapparent infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                         | <ol style="list-style-type: none"> <li>2. Antibiotic therapy is needed to eliminate the organism and prevent spread and is not a substitute for antitoxin. Throat and nasopharyngeal swabs should be taken prior to starting antibiotic therapy.</li> <li>3. The management of cases involves respiratory isolation until: <ol style="list-style-type: none"> <li>a. Two cultures from nose, throat or lesions have been taken 24 hours apart and are negative for <i>C. diphtheriae</i>.</li> <li>b. Cultures are taken no earlier than 24 hours after completion of antibiotic treatment.</li> </ol> </li> <li>4. Once recovered, the case should receive a complete primary series of diphtheria-containing vaccine according to the Nunavut publicly funded immunization schedule and the age of the case.</li> <li>5. All bedclothes and clothing articles that have been used in the care of any infected individual should be washed with hot soapy water.</li> <li>6. Individuals with diagnosed Diphtheria are to be excluded from school, child-care centres and work until two cultures taken from the nose and throat or lesions are negative. These cultures must be taken at least 24 hours apart and taken 24 hours after the completion of antibiotic therapy. Consult with the RCDC.</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Contacts</b>         | <p>With regard to Diphtheria, contacts are defined as:</p> <ul style="list-style-type: none"> <li>• Household members;</li> <li>• Persons who have had close face-to-face contact of a case, such as intimate contact, sharing the same room at school or work;</li> <li>• Health care providers exposed to oropharyngeal secretions from the case.</li> </ul> <ol style="list-style-type: none"> <li>1. All identified contacts should have swabs taken from the nose and throat and sent for culture regardless of immunization status. They should also be started on a prophylactic course of seven days with oral erythromycin or given a single dose of procaine penicillin IM as prophylaxis.</li> <li>2. Contacts should also be kept under surveillance for seven days for signs and symptoms of Diphtheria.</li> <li>3. Inadequately immunized contacts should receive appropriate immunization in accordance with the Nunavut publicly funded immunization schedule.</li> <li>4. Contacts must be excluded from occupations involving food handling, close contact with children under 7 years of age, known immunocompromised persons, care of sick and from school until treatment is complete and cultures from the nose and throat or lesions are negative. Consult with the RCDC.</li> <li>5. Diphtheria antitoxin is not recommended for prophylaxis of close, unimmunized contacts of Diphtheria cases, given the substantial risk of allergic reaction to horse serum and no evidence of additional benefit of antitoxin for contacts who have received antimicrobial prophylaxis.</li> <li>6. Complete the <a href="#">Vaccine Preventable Diseases Contact Investigation Form</a> dated March 2014 or later (section 7.1.3). Include additional pages for contact information as necessary.</li> </ol> |
| <b>Outbreaks</b>        | If a single case of Diphtheria is suspected, contact your RCDC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                                      |                                                                                                                                                                                                                                                                                             |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Infectious Agent</b>              | There are over 100 types of Human Papillomavirus (HPV) with ≥18 being high risk oncogenic types. Up to 40 HPV types infect the genital tract.                                                                                                                                               |
| <b>Clinical</b>                      |                                                                                                                                                                                                                                                                                             |
| <b>Clinical Presentation</b>         | Most HPV infections are asymptomatic, subclinical or go unrecognized. Symptoms are virus type dependant and can include: pain, itching, bleeding and presence of warts in the ano-genital area. Late manifestations include cancerous changes to cells of: cervix, anus, penis, oropharynx. |
| <b>Diagnostics</b>                   | Women: A pap test screens for abnormal cervical cells and may identify HPV if present.<br><br>Men: There is no regular HPV screening. Physical examination can identify external HPV lesions such as warts in the genital and adjacent areas.                                               |
| <b>Treatment</b>                     | External HPV or genital warts can be treated. Abnormal cellular changes should be referred to a specialist.                                                                                                                                                                                 |
| <b>Pathogen</b>                      |                                                                                                                                                                                                                                                                                             |
| <b>Occurrence</b>                    | <b>Worldwide:</b> HPV is one of the most common sexually transmitted infections.<br><b>Canada:</b> The overall prevalence in Canada is 11% to 29% for any HPV types.<br><b>Nunavut:</b> A study in 2001 identified a prevalence of 26% for oncogenic types of HPV among 1,290 females.      |
| <b>Reservoir</b>                     | Humans                                                                                                                                                                                                                                                                                      |
| <b>Transmission</b>                  | Sexual transmission by direct epithelial (skin or mucosa) to epithelial contact and vertical transmission to an infant exposed to the virus in the maternal genital tract.<br><br>Subclinical infection may still cause viral transmission to a partner.                                    |
| <b>Incubation Period</b>             | About 2-3 months for genital warts (range is 1-20 months).                                                                                                                                                                                                                                  |
| <b>Communicability</b>               | Unknown. Likely as long as infection persists.                                                                                                                                                                                                                                              |
| <b>Susceptibility and Resistance</b> | Most HPV infections are self-limiting, clearing within 24 months. Persistent infection with oncogenic types may lead to cancer.                                                                                                                                                             |
| <b>Public Health Management</b>      |                                                                                                                                                                                                                                                                                             |
| <b>Case</b>                          | No follow-up of reported cases is required.                                                                                                                                                                                                                                                 |

## 7.3.1 *Haemophilus Influenzae* (Hi), Invasive

### Special Precautions/Considerations

Precautions: Droplet and contact

#### Reporting

Notifiable: Yes

Reporting: Immediate (as soon as suspected)

| <b>Infectious Agent</b>      | <i>Haemophilus influenzae</i> are Gram-negative coccobacilli that are divided into unencapsulated (non-typeable) and encapsulated strains. The encapsulated strains are further classified into serotypes a through f.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Clinical</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Clinical Presentation</b> | <p><b>(1) <i>Haemophilus influenzae</i> type b (Hib) and non-type b (including type a)</b><br/>Often presents as meningitis, pneumonia, bacteremia and epiglottitis, depending on which part of the body is affected. Other less common illnesses include: endocarditis, osteomyelitis, and gangrene.</p> <p><b>(2) <i>Haemophilus influenzae</i> non-typeable (NT-Hi)</b><br/>It is more common to see respiratory tract infections such as otitis media, sinusitis, pneumonia and conjunctivitis. However some non-type b strains can cause disease similar to type b infection.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Diagnostics</b>           | <p>It is important to note that <b>only invasive disease</b> is reportable. Laboratory criteria for diagnosis requires the isolation of <i>H. influenzae</i> by culture from a normally sterile site (e.g. blood or cerebrospinal fluid or, less commonly, joint, pleural or pericardial fluid). Aspirates are usually from sterile sites, and such cases are included in the surveillance definition. An aspirate culture can be obtained through needle aspiration or during a percutaneous drainage procedure.</p> <p>Follow your regional laboratory procedures for diagnostic testing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Treatment</b>             | A discussion of the treatment of invasive Hi is beyond the scope of these guidelines. Consult with physician for treatment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Occurrence</b>            | <p><b>Worldwide:</b> Prior to the introduction of an effective vaccine, Hib was the leading cause of bacterial meningitis and other invasive bacterial disease among children less than five years of age. Almost all serious Hib infections were in children less than five; two thirds of these cases were in children less than 18 months old. Since the introduction of the Hib conjugate vaccines, there has been a shift of <i>H. influenzae</i> to other types.</p> <p><b>Canada:</b> Prior to the introduction of Hib conjugate vaccine in Canada there were approximately 2,000 cases of Hib disease reported annually. From 1995 to 1999 fewer than 65 cases of invasive Hib were reported annually. Of these, the highest numbers were reported in children less than nine years of age and in adults over the age of forty.</p> <p><b>Nunavut:</b> From 1999-2011 there have been 86 cases of Hi with 12 being Hib for a yearly average of 5.01 Hib cases per 100,000. Of the 86 Hi cases, 52 were HI type a (Hia) for a yearly average 14.35 per 100,000. Majority of cases for Hib and Hia were under 2 years of age.</p> |

| <b>Communicability</b>               | The exact period of communicability is unknown but is thought to be up to 7 days prior to the onset of illness. It may remain communicable for as long as organisms are present in nose and throat. Carriage may occur indefinitely in up to two to five percent of children. Appropriate antibiotic treatment reduces communicability within 24-48 hours.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
